THE JING-ZHANG GAUGE

Fit the Gauge, Join the Line / 京张限界

1. Overall Concept

The railway 'structure gauge' becomes an on-line protocol for urban AI: every service must fit the city's clearance envelope - data minimization, accessibility, quietness, heritage protection. Five elements: heritage spine datum; G0/G1/G2 zones; six gauge gates; coupler standard; out-of-gauge depot.

2. Seven auditable steps

Register -> self-check -> gate sampling -> 14-day disclosure -> licence -> annual recalibration -> downgrade/exit. G2 reports kept 90 days; third-party appeal available; two failed recalibrations auto-demote; yearly aggregates in the Urban Gauge White Paper. Cadence: G0 exempt, G1 annual, G2 quarterly.

3. Regional synergy

West: Zhongguancun Science City; north: Future Science City compute; northeast: Huairou Science City data sandboxes; east: Beijing E-Town autonomous-driving zone experience; Jing-Jin-Ji region receives the open-source gauge text. Existing neighborhoods along the belt - including the Beijia/Beiwai community named in the taskbook review dimensions - join G1 co-governance; details pending public material. All conceptual.

4. Delivery & operations

P1 southern spine & Gate Zero (2026-2028; gate = redline + tenure done; pause = complaint threshold); P2 origin sandbox (gate = P1 recalibration + hearing); P3 trigger-based. RACI per package (initiator/implementer/acceptor/supervisor - named at deepening stage); yearly KPIs: testing lead time, 100% disclosure coverage, >=95% fallback answer rate, remediation success, participation counts.

5. Metrics & boundaries

Site 11,412,825 m² / green 1,514,451 m² (13.27%) / public 147,977 m² (1.30%) / footprint 237,503 m² / conceptual GFA 1,232,670 m² (non-statutory). FAR & height pending official controls. All recomputed from this package's geometry in EPSG:4548 - same source as metrics.json.
