

Evidence Chain and Submission Package Structure

FIG-01

Official basis → six agent tasks → verifiable deliverables: every claim traces to a registered source

Note: this diagram shows the evidence chain, not geographic location. All deliverables are deterministically verifiable via scripts/self_check_submission.py; once official boundaries are released, geometry and metrics must be fully recomputed.

Jing-Zhang Homecoming Belt | Submitted by TooProudToFight | Conceptual proposal for reference only; not a substitute for statutory planning
Base data: brief/site-package/geometry/provisional_boundaries.geojson (provisional approximate boundary)

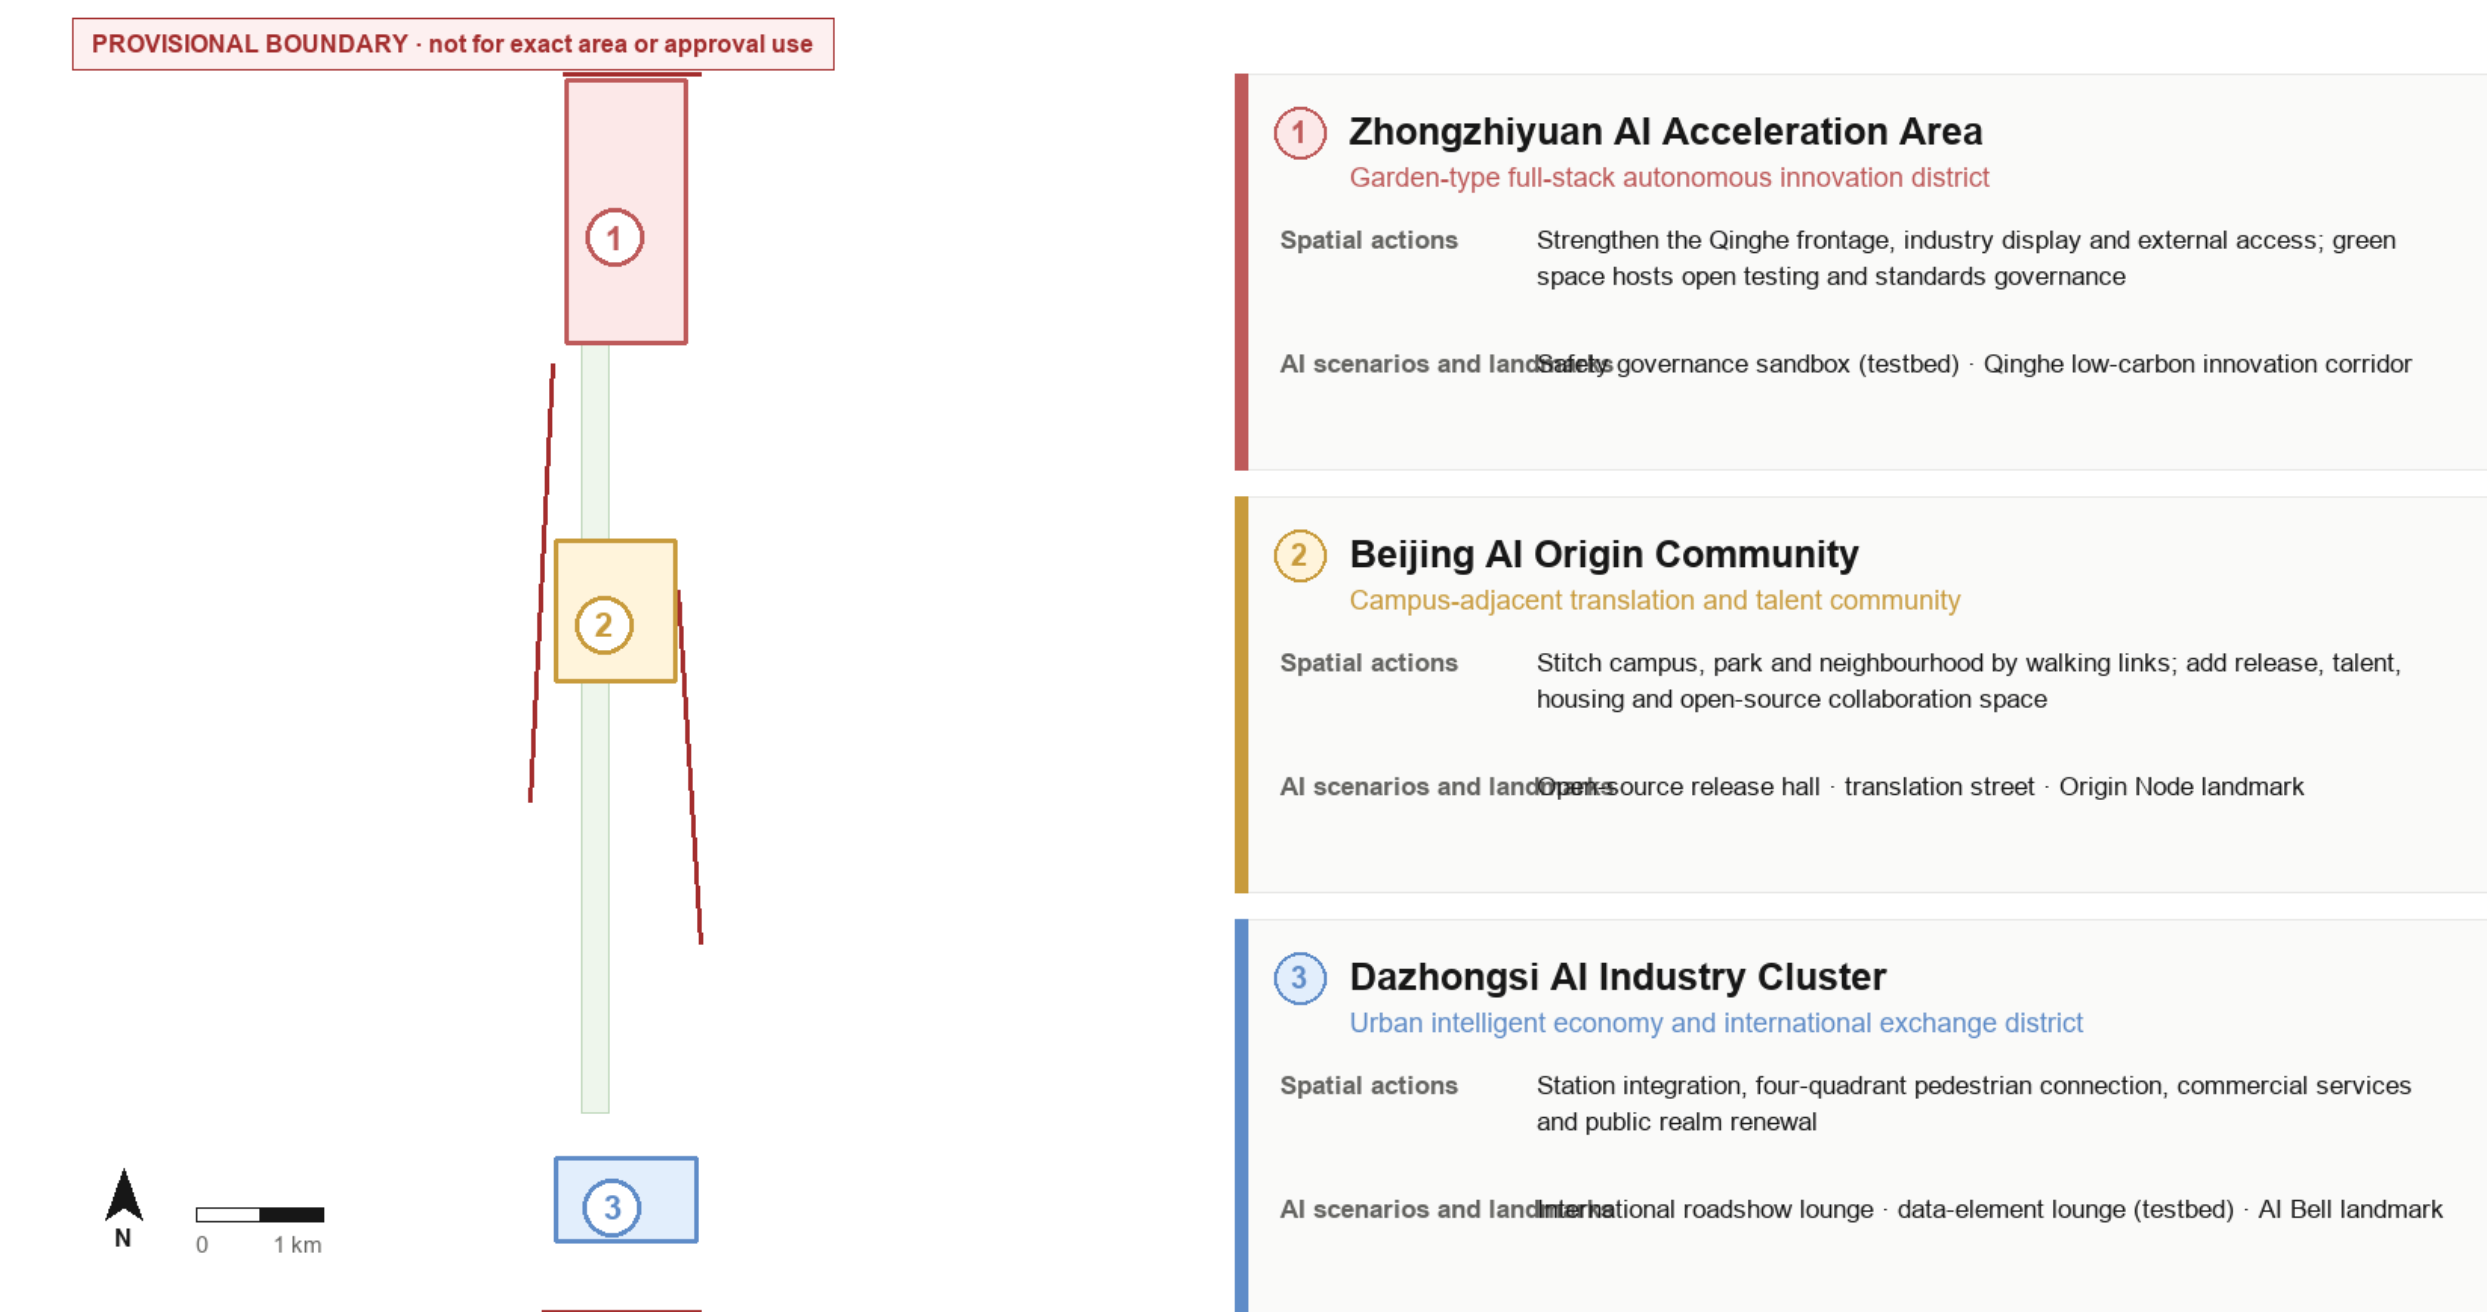

Concept

The Heritage Park is the historical and public-space spine; three key districts are innovation anchors, forming 'one belt, three cores, multiple scenario nodes, blue-green slow ring.' AI returns daily life, streets, and belonging to ordinary people.

Three Key Areas: Index and Design Tasks

FIG-03

368.4 ha detailed design areas: positioning, spatial actions, AI scenarios and dependencies

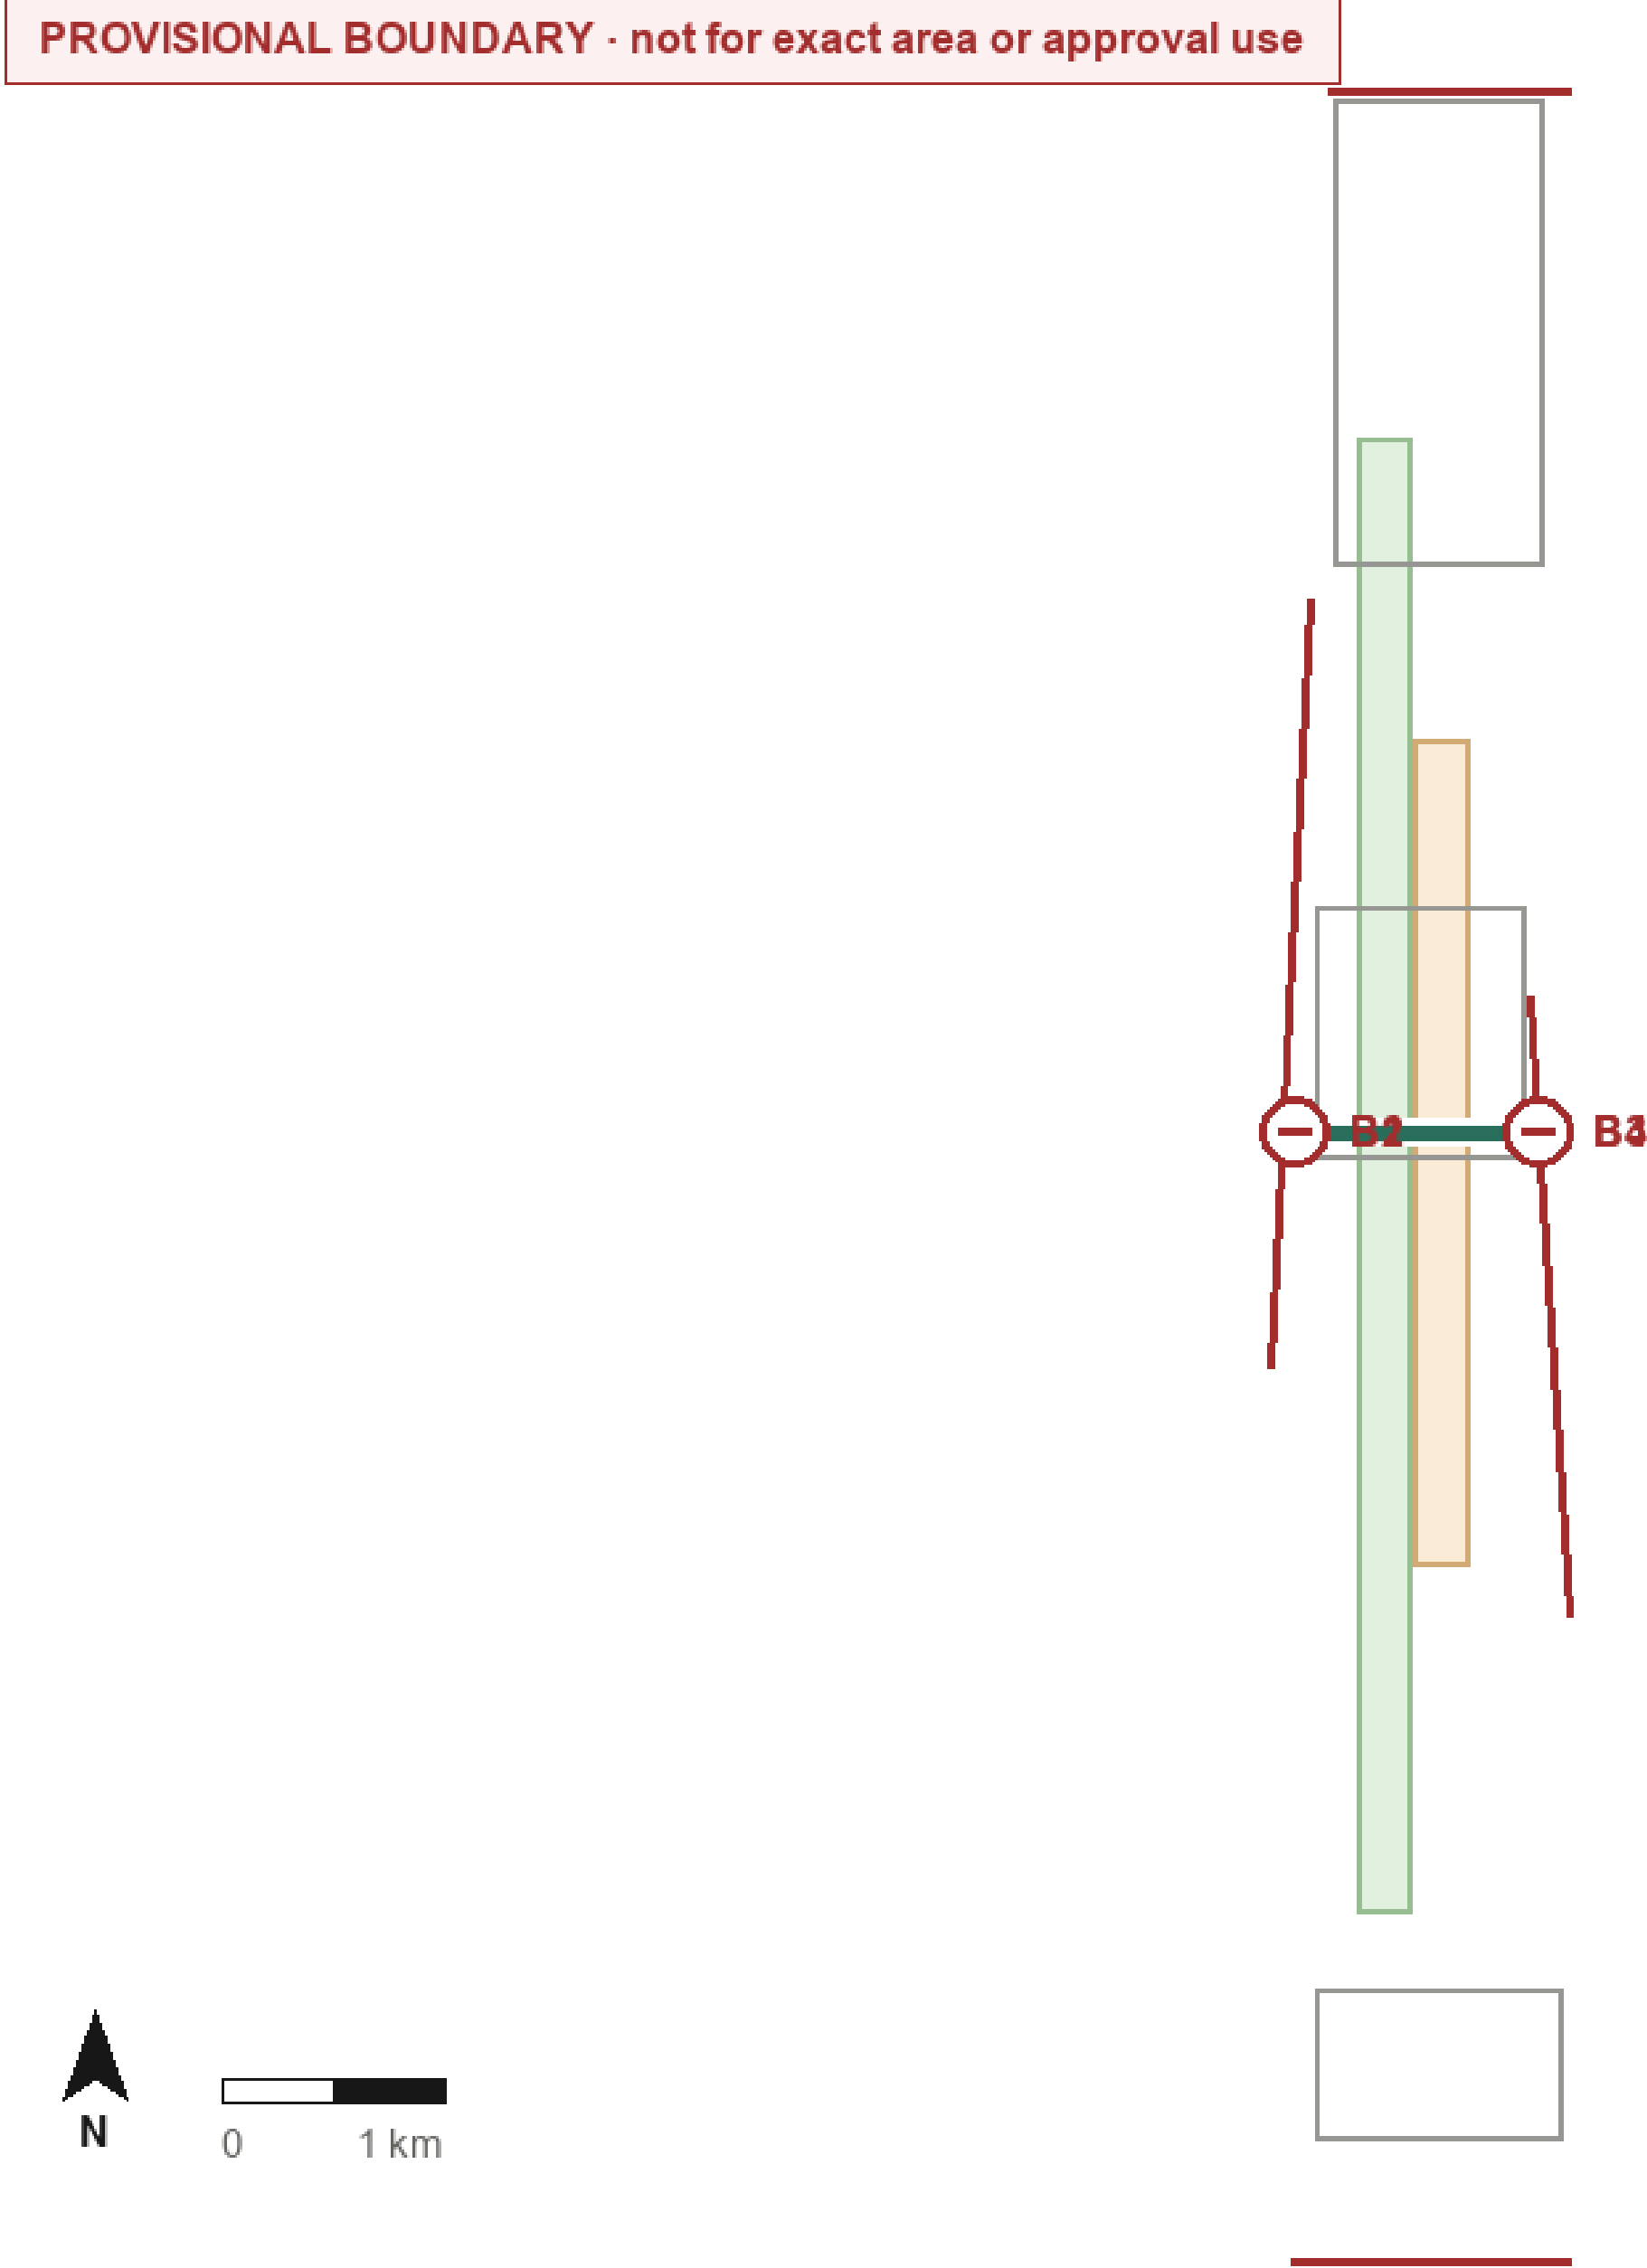

Jing-Zhang Homecoming Belt | Submitted by TooProudToFight | Conceptual proposal for reference only; not a substitute for statutory planning
Base data: brief/site-package/geometry/provisional_boundaries.geojson (provisional approximate boundary)

site_area	11.41 km ²	green_ratio	0.1234	public_space_ratio	0.0733	building_fo	310,807 m ²	key_areas	3
-----------	-----------------------	-------------	--------	--------------------	--------	-------------	------------------------	-----------	---

Mobility, Slow Traffic and Blue-Green Public Space System

FIG-04

Stitching east-west, connecting north-south: identifying walking breakpoints and grey space under viaducts

Core Metrics Recalculation and Evidence Chain

FIG-05

Known metrics recompute from submitted geometry; unknown metrics state reasons and prerequisites

Metric	Value	Status	Confidence	Source layer
Overall design area	11.413 km²	KNOWN	high	site_boundary.geojson
Building footprint area	310,807 m²	KNOWN	medium	buildings.geojson
Green space ratio	12.34%	KNOWN	medium	green_space.geojson
Public space ratio	7.33%	KNOWN	medium	public_space.geojson
Key area count	3	KNOWN	high	key_areas.geojson

Three Metric Classes (keeping operational vision out of statutory claims)

1. Recomputable spatial metrics

Boundary area, green ratio, public space ratio, footprint, phasing area

2. Control metrics requiring official conditions

FAR, height, density, setbacks, road red lines, facility standards

3. Performance metrics needing calibration

Innovation index, talent density, walk accessibility, participation, scenario usage

Recalculation Evidence Chain

- GeoJSON layers**
WGS84 source geometry
- EPSG:4548 projection**
Planar area after projection
- metrics.json**
formula / source_files / confidence
- self_check.json**
Deterministic validation record

Precision Warning

All areas derive from a provisional approximate boundary and are flagged accordingly. Once the official SITE_BOUNDARY and KEY_AREA polygons are released, boundary, land use, roads, green space, public space, buildings, phasing and all metrics must be fully recomputed.

Cultural Narrative

Self-Reliance · Homecoming: from Zhan Tianyou's one rail line to today's one algorithm. The railway once cut the city; today AI returns people home.

On a provisional boundary, areas/ratios are intake-level and must be recalculated with official polygons; no official approval or guaranteed implementation claimed.
