

A public belt, not an AI installation

Three nodes / five functions / one reversible operating contract

The formal proposal maps the taskbook positions and functions to three key areas, two wings, 14 scenario rows, eight physical components, a regional eight-mechanism loop, and path-level rights evidence. All active systems have a passive human equivalent and a withdrawal path.

Node plans and public-interest audit

Space, operations, participation and equity are tested before scale

Zhongzhi Garden is a bounded research garden; AI Origin Community is an open conversion neighbourhood; Dazhongsi is a public station and service room. Baselines are unknown until surveyed. Accessibility, service without an app, complaint response, group differences and night light/noise are explicit audit items.

Evidence and recalculation

Official data, provisional geometry and modeled scores remain separate

The package retains source IDs, years, units, unknown fields, relative decision scores, clearance hashes and stop gates. Official polygons, planning controls, ownership, drainage, transport and measured experience must replace provisional fields before implementation.

Director view / the city returns control

Request → review → bounded run → evidence → ordinary public use

The city is treated as a living handover line. Robots run only in a declared window; a human lead remains accountable; a resident can read status and complain; and a failed safety, rights, drainage, accessibility or resident-impact gate returns the space to ordinary human operation.
