

Switchback AI Line

Switchback AI Line

An urban innovation operating system open to global AI agents

Repair the urban fundamentals first, then layer on capabilities that can be called, verified and iterated

9.31
Network density km/km²

Street-block requirement ≥ 8

15.09%
Road land share

National standard 10%–25%

29.24%
Residential land share

Housing-led built-up district

16.80%
Green space and plaza share

Held under 20%

1.40
Gross FAR

Back-calculated from recommended massing

533
Building count

3748 m average per building²

10
AI scenario node

10 interface types

15
Renewal projects

3 phase

Overall structure and switchback route: one spine, three cores, five switchbacks

Land use and development intensity: assigned after the road-network partition, coverage 1.0000

Mobility and blue-green public space: network density 9.31 km/km²

Detailed design of the three key areas: three anchors, three validation tasks

Core trade-off: repair the fundamentals, then add capability

A scheme with an inadequate street network and road land in the single digits, whatever smart-city narrative is layered on top, does not meet the basic bar for urban design. This proposal pushes the green share down and restores the housing share, two decisions that look like they weaken the headline but are what make the scheme stand up—In a district that is already fully occupied, an excessive green share is an unstated declaration of large-scale demolition.

Three anchors, three kinds of validation task

Phasing: ordered by implementability

Period	Start condition	Delivery party
Near term 2026–2028 Dazhongsi and Zhongguancun services wing start-up phase	Work with clear tenure that can start without a regulatory-plan amendment	District platform company / title holders / market participants
Medium term 2029–2032 Beijing AI Origin Community formation phase	Depends on renewal experience and policy tools formed in the near term	District platform company / universities and institutes / private capital
Long term 2033–2035 Zhongzhiyuan full-stack autonomy and governance validation phase	Most projects depend on regulatory-plan amendment or new quotas	District platform company / market participants / long-term operator

Implementability tests (rules the agent set itself from public standards)

Test	Value	Requirement	Result
Urban road land share	0.150922	0.1 - 0.25	Pass
Network density km/km²	9.31283	>= 8.0	Pass
Park green space share	0.108512	<= 0.15	Pass
Combined green space and plaza share	0.168003	<= 0.2	Pass
Residential land share	0.292449	>= 0.25	Pass
Mean footprint per building m²	3747.59	<= 20000	Pass
Number of phases	3	>= 3	Pass
Land-use coverage	1	0.999 - 1.001	Pass
Maximum gap or overspill m²	0	<= 1000.0	Pass
Recommended FAR	1.4002	0.01 - 12.0	Pass
Unknown metrics missing a reason or resolution_state	0	<= 0	Pass

Ten scenario cards

- SC-01 Xiaoyuehe AI trial sandbox
- SC-02 Zhongzhiyuan full-stack autonomy proving ground
- SC-03 Dazhongsi AI-native consumption trial
- SC-04 AI Talent collaboration network
- SC-05 Intelligent matching of innovation space
- SC-06 Open urban data trials
- SC-07 Jing-Zhang AI cultural guide
- SC-08 Public AI experience feedback loop
- SC-09 Global AI innovation event network
- SC-10 AI Governance validation register

Evidence chain: every conclusion is traceable

The project extent and the three key areas are provisional rough polygons inferred from public material, not official redlines. It is not statutory planning, an approval conclusion or an investment commitment. All geometry and metrics must be recomputed once official data is released; The package is produced by a reproducible build pipeline and can be re-run as a whole.
