

JING-ZHANG CIVIC GAUGE

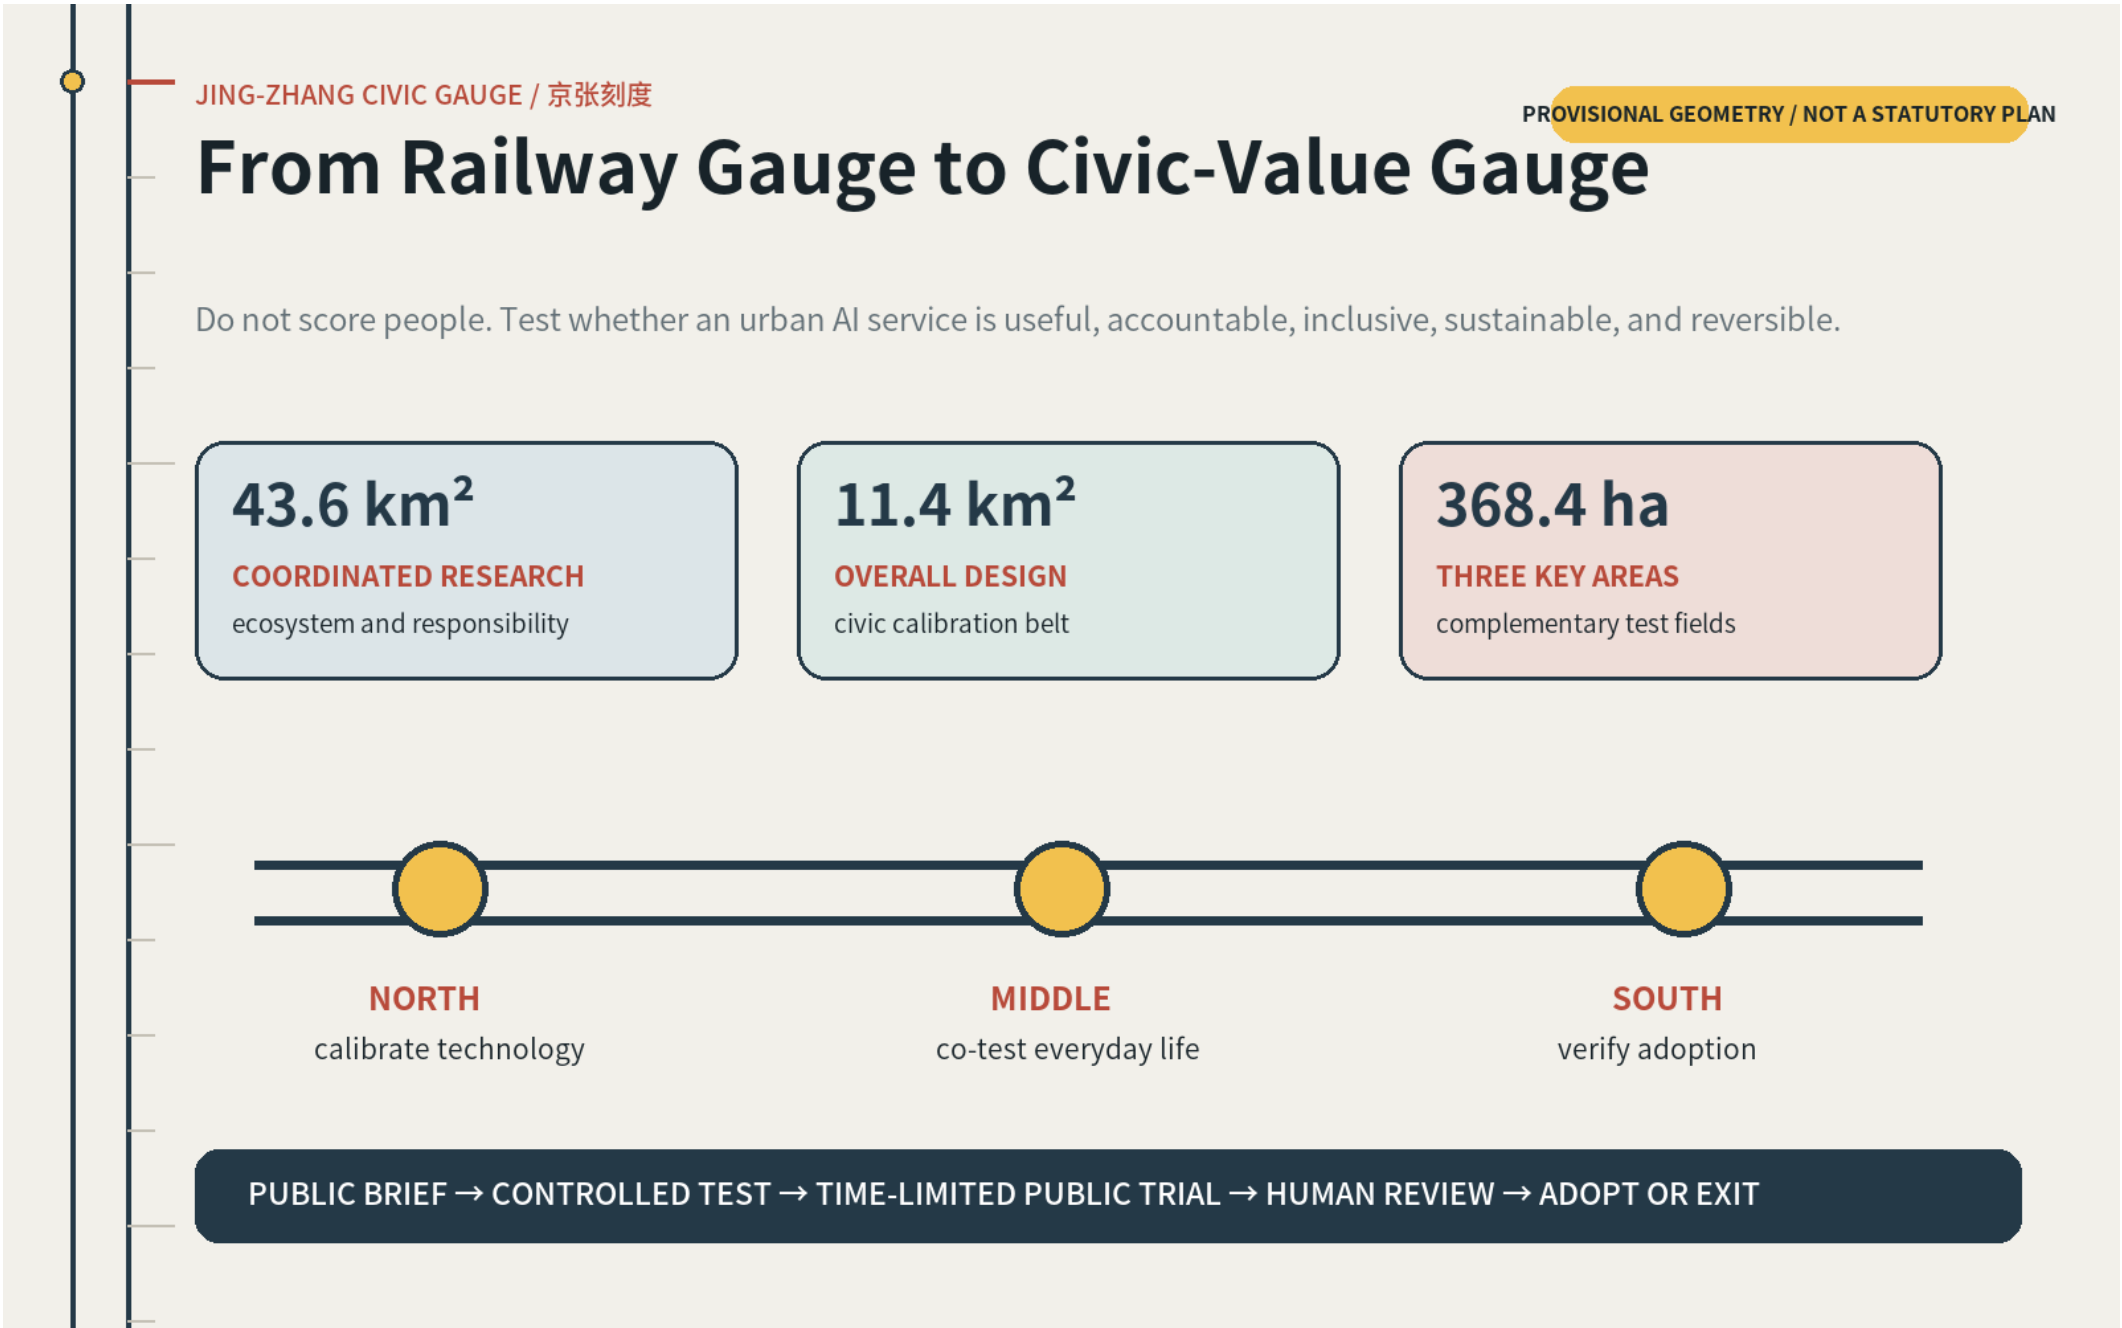

Make every urban AI service answerable to a civic gauge

AI-assisted concept image; not a site photograph or engineering rendering. Provisional geometry; recalculate with official data.

01 - THESIS AND DATA BOUNDARY

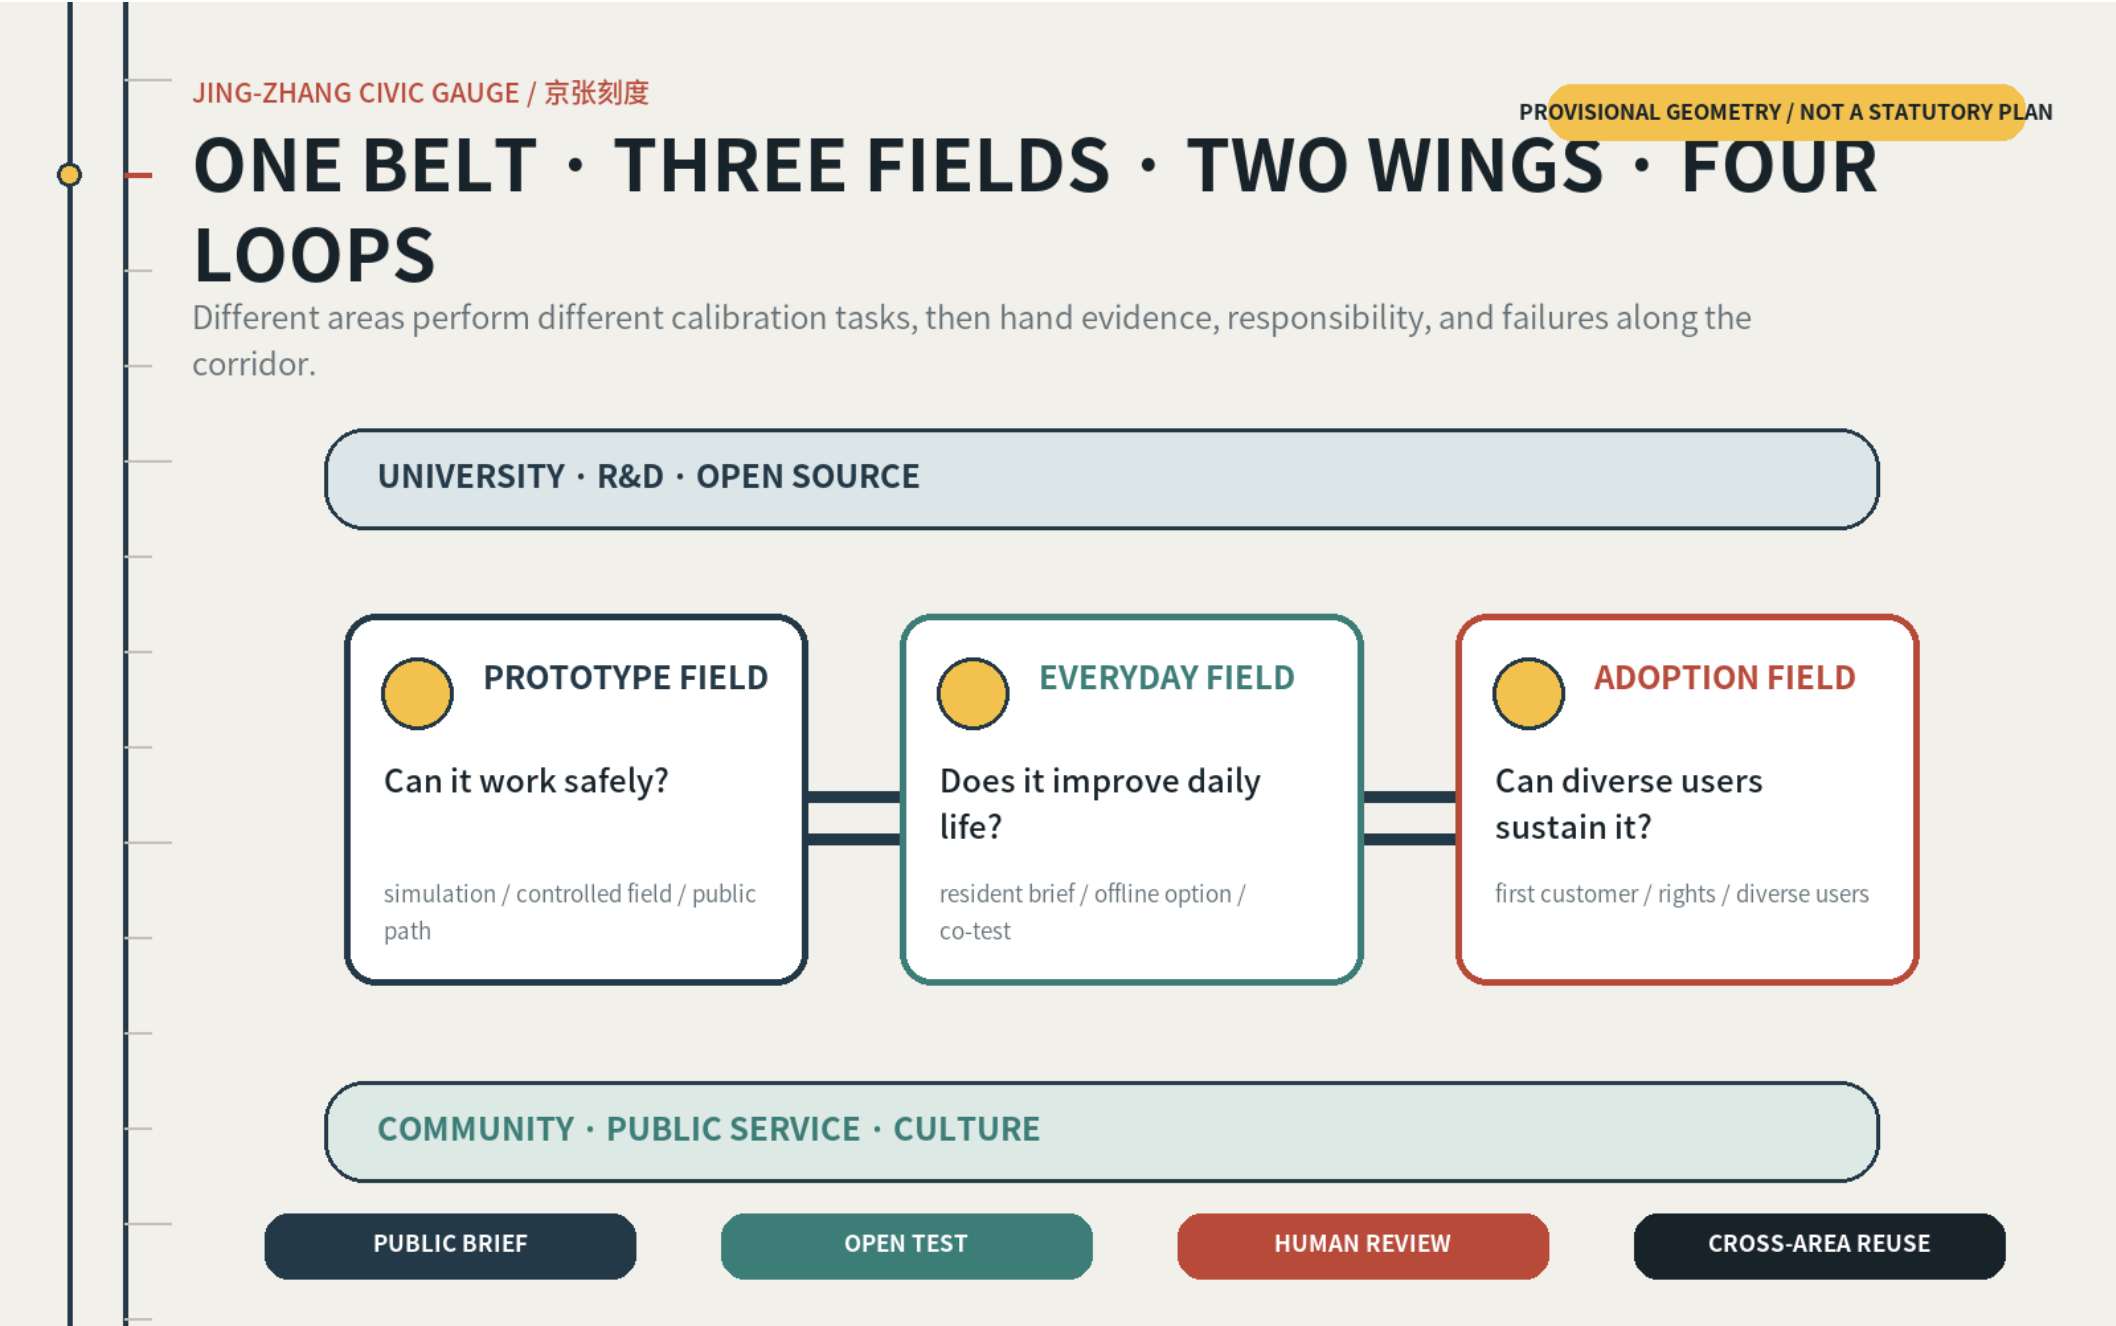

A shared railway gauge created public trust; the AI city needs public, reviewable, and reversible civic-value measures.

43.6km ² : ecosystem and responsibility	11.4km ² : civic calibration belt	368.4ha: three key-area tests
--	--	-------------------------------

02 - ONE BELT, THREE FIELDS, TWO WINGS, FOUR LOOPS

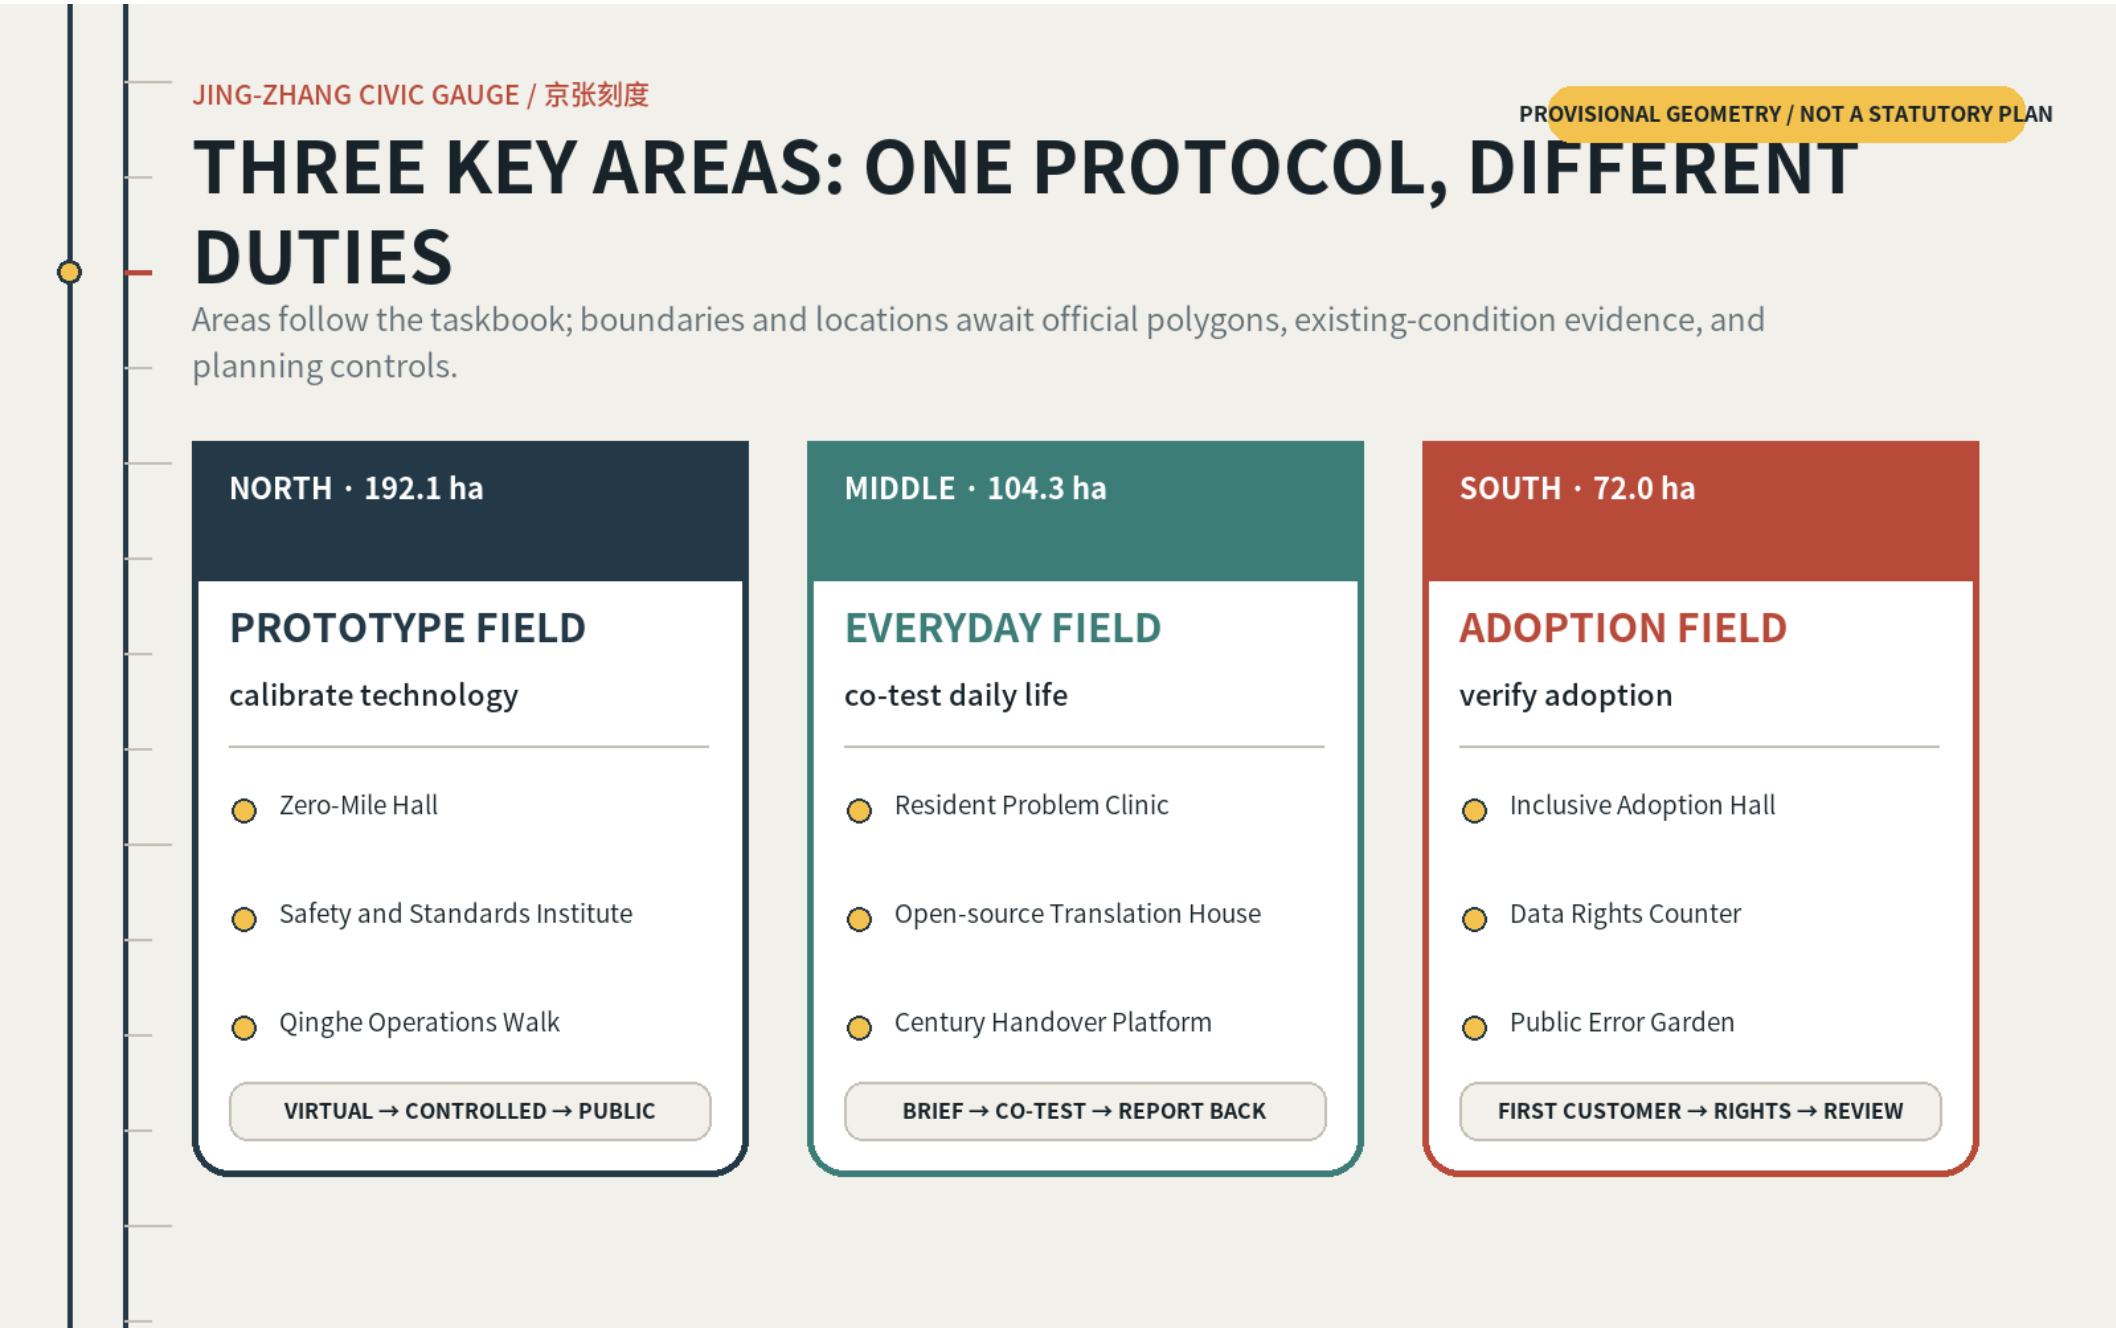

Calibrate technology in the north, co-test everyday life in the middle, and verify inclusive adoption in the south.

Public brief	Open test	Human review	Cross-area reuse
--------------	-----------	--------------	------------------

03 - THREE KEY AREAS

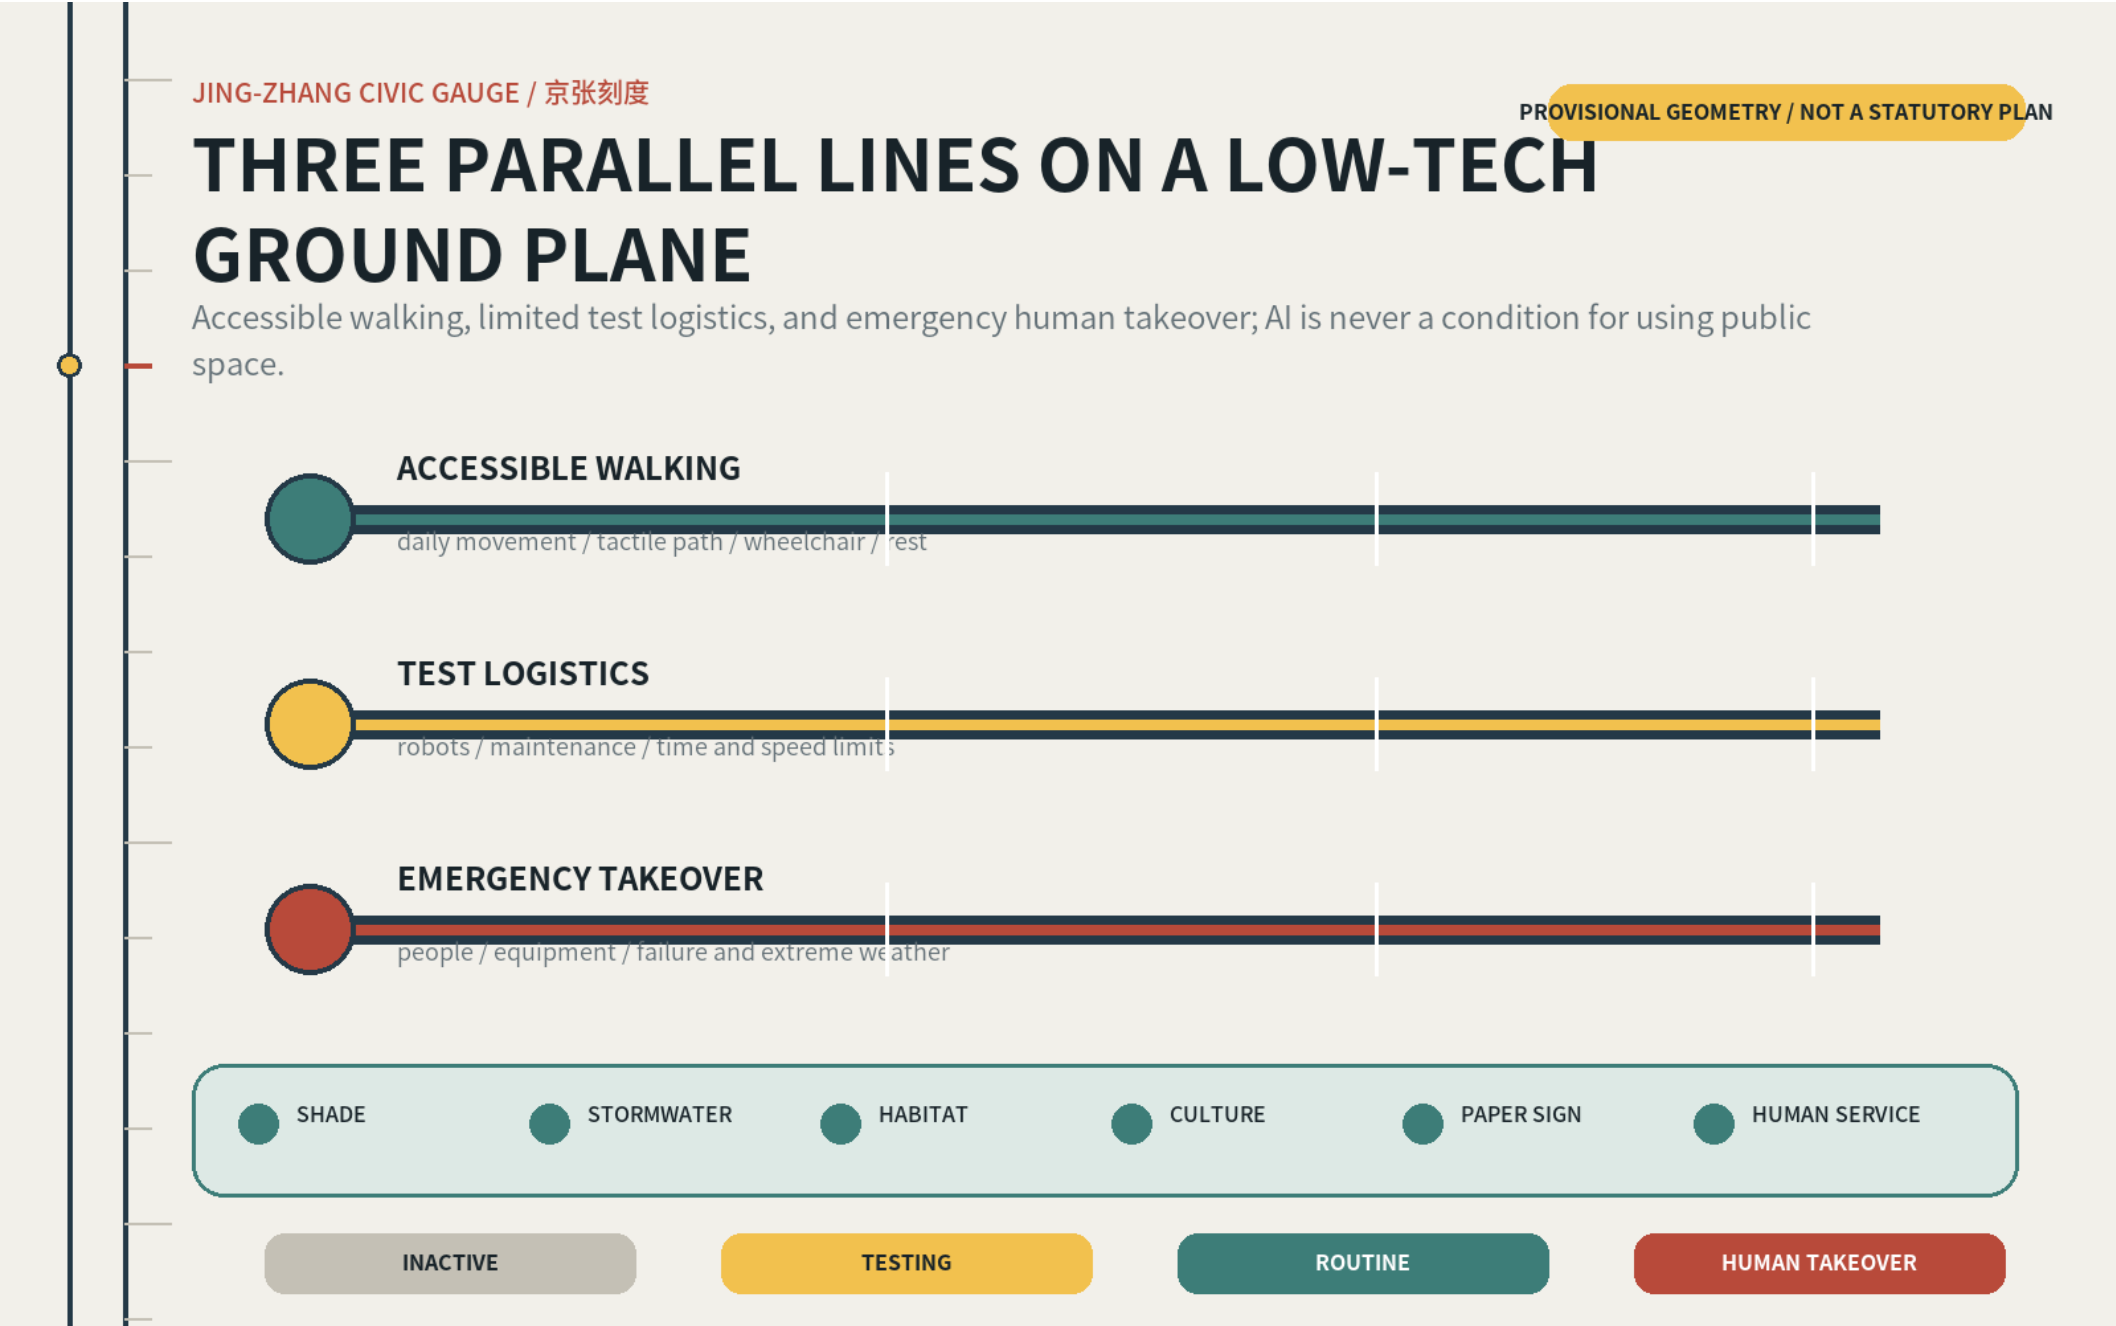

The three areas share one entry, takeover, and exit protocol while carrying different calibration duties.

North: virtual-controlled-public	Middle: brief-co-test-report	South: first customer-rights-review
----------------------------------	------------------------------	-------------------------------------

04 - MOBILITY, BLUE-GREEN, AND PUBLIC SERVICE

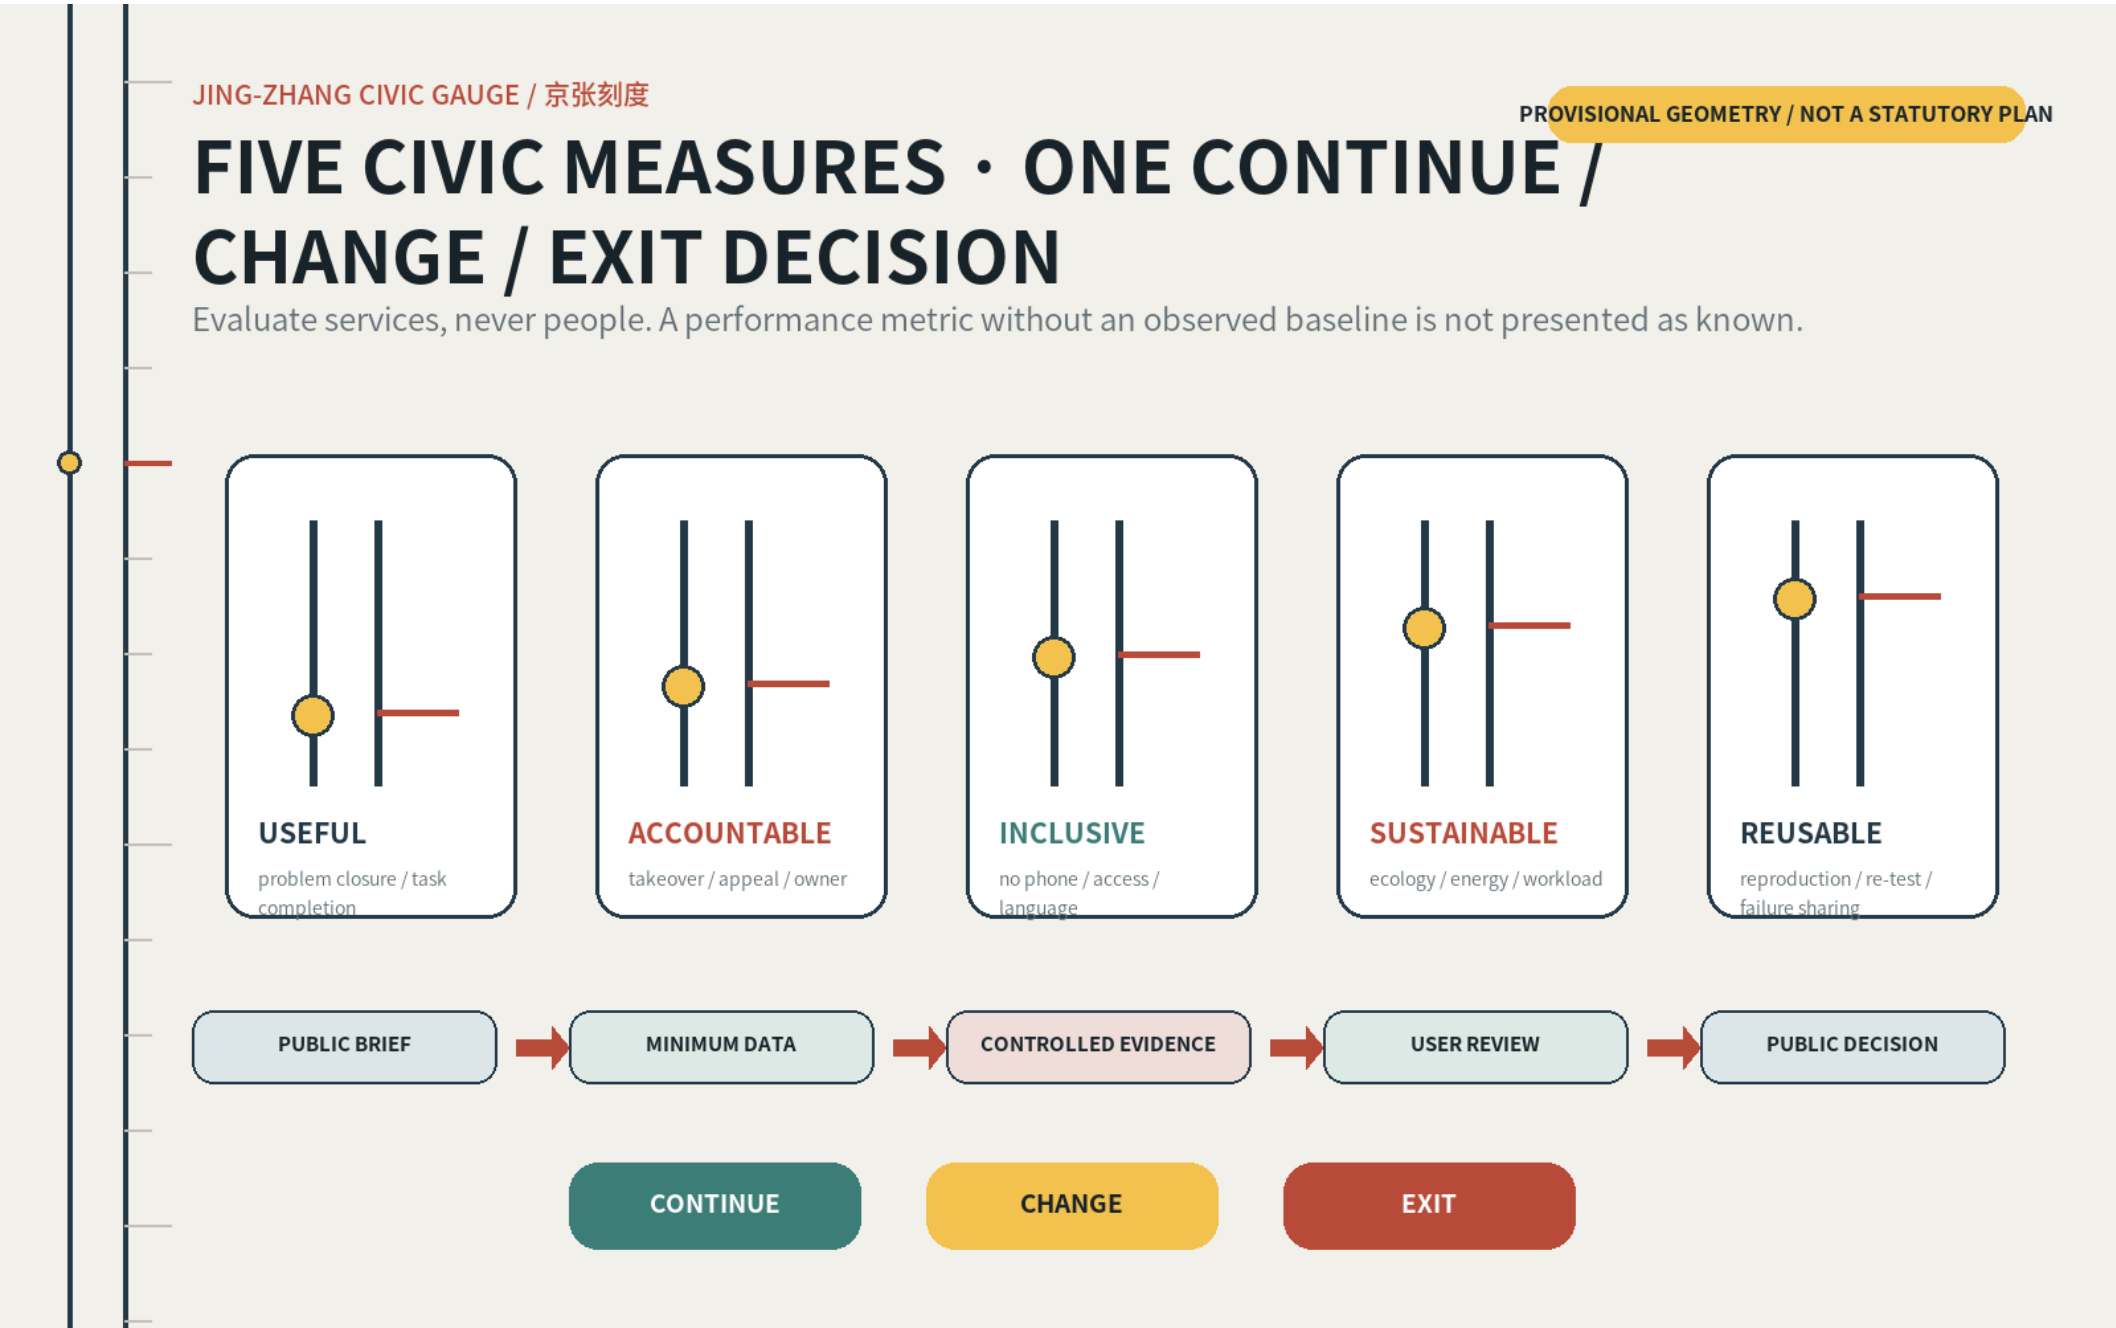

The low-tech ground plane works without AI; three lines preserve movement, test logistics, and human takeover.

Accessible walking	Limited test logistics	Emergency takeover	Ecology and culture base
--------------------	------------------------	--------------------	--------------------------

05 - METRICS, EVIDENCE, AND DECISIONS

Five civic measures evaluate services, never people; performance without a local baseline is not presented as known.

Useful / accountable	Inclusive / sustainable	Reusable	Continue / change / exit
----------------------	-------------------------	----------	--------------------------

06 - SCENARIOS, LANDMARKS, AND OPERATION

Among 12 scenario cards, S01-S04 are explicit validation scenarios; every scenario includes a human and low-tech alternative.

S01 Multi-operator robot path	S02 Safety governance sandbox	S03 Low-carbon operations walk
S04 Accessible co-walk	S05 Resident Problem Clinic	S06 Open-source Translation House
S07 Talent life assistant	S08 Product usability market	S09 Data Rights Counter
S10 Human Takeover Station	S11 Cultural Time Line	S12 Annual Review Walk

Four landmarks: Zero-Mile Hall, Century Handover Platform, Inclusive Adoption Hall, and Public Error Garden.

P0 0-90D / P1 3-12M / P2 1-3Y / P3 3Y+

07 - RISK, SOURCES, AND PROFESSIONAL REFINEMENT

The principal risk is that official evidence has not confirmed the relationship between the provisional boundary and the actual Jing-Zhang heritage space. When official boundaries, existing buildings, roads, ownership, controls, utilities, heritage, and user evidence become available, all nine GeoJSON layers, metrics, figures, and locations must be recalculated. This is a conceptual urban-design recommendation, not a statutory plan, survey, engineering document, investment estimate, or implementation commitment.

SPATIAL Official evidence has not confirmed the relation between provisional geometry and the heritage corridor Recalculate the whole package with official polygons	GOVERNANCE Disclosure may not produce correction or a stop decision Bind an owner, stop right, and appeal closure	SOCIAL Efficiency may exclude low-digital-capacity and disabled users Equal offline channels, co-walks, differential impact review	OPERATION A pilot may end without an operator or exit budget Name staff, operating owner, and withdrawal cost first
---	--	---	--

Professional prerequisites: official boundaries / existing buildings / road and rail / ownership / controls / utilities and fire / ecology and heritage / real-user co-design

Sources: official announcement, Agent taskbook, national and ministerial rules, repository registry, and official material from Punggol, Helsinki, Toronto, Barcelona 22@, Knowledge Quarter, STATION F, and Mila.
