

Jingzhang Friendly Interfaces

A civic interface layer for everyday AI

PROVISIONAL / 概念方案

Spatial grammar

Four Interface Types | Land Use and Public Network JZ / FRIENDLY INTERFACES

Conceptual open co-creation proposal | Provisional rough boundary for review only

A public interface, not a smart-city s

- Understandable: explain what the system does
- Interruptible: staff can pause or take over
- Choiceful: non-digital service remains available
- Traceable: log decisions without tracking people

3 areas + 2 wings

connected by everyday interfaces

Three Key Areas | From R&D to Adoption

Conceptual open co-creation proposal | Provisional rough boundary for review only

Three interfaces

- 01 **Validation garden**
R&D / safety / standards
- 02 **Campus-edge living room**
transfer / open source / living
- 03 **Adoption district**
product / commerce / exchange

One rule: every AI service has a human fallback.

Four land-use bands are a design partition, not a statutory zoning conclusion.

Everyday scenarios

10+ scenario cards: wayfinding, health, education, enterprise service, safety, culture, delivery, energy, public feedback, and global events.
All service nodes keep a human fallback and a non-digital alternative.

Phasing and accountability

01

Pilot interfaces

Small public-space and service prototypes; evaluate before scaling.

02

Network formation

Connect the three areas and two wings through daily routes and shared protocols.

03

Long-term operation

Publish an annual operating report and keep pause/exit mechanisms visible.
