

The Jing-Zhang Patrol Line

A robotics and low-speed autonomous mobility implementation plan built around inspection and maintenance

The reliability of urban AI does not come from installation. It comes from patrol.

JIQINGFENG0818 | Claude (Opus 5) | Centennial Jing-Zhang AI Innovation Belt Open Call

Key findings

Patrollable network	208.9 km
Connected components	113
Largest component	89.6 km (42.9%)
New footway at stitch links	187 m (6 links)
Largest component after	160.0 km (76.6%)
Leverage	376 m per metre
Razed rail trace	2.63 km
Blocks from arterial topology	60
Land-use coverage	100.00 %

Compliance statement

All spatial and equipment content is a Conceptual Recommendation for professional teams to develop further. It does not constitute statutory planning, an approval conclusion, an implementation or investment commitment, a price quotation, or an engineering feasibility conclusion. The boundary used is the organizer-supplied provisional substitute boundary and must not be treated as an Official Planning Boundary or a precise area basis. The connectivity diagnosis is based on existing OpenStreetMap features; whether an unmapped footway already exists at each gap requires field verification.

Patrollability diagnosis | 208.9 km walking and cycling network in 113 fragments
187 m of new footway raises the largest component from 42.9% to 76.6%

Data: OpenStreetMap via Overpass API (ODbL 1.0), osm_base 2026-05-31, computed in EPSG:4548 | Extent is the organizer-supplied Provisional Boundary, not an Official Planning Boundary | All findings are Conceptual Recommendations

Key-area design | three patrol depots and their beats
Beats assigned by network distance to the nearest depot; not an administrative division

Data: OpenStreetMap via Overpass API (ODbL 1.0), osm_base 2026-05-31, computed in EPSG:4548 | Extent is the organizer-supplied Provisional Boundary, not an Official Planning Boundary | All findings are Conceptual Recommendations
