

JINGZHANG STEADY FIELD

STEADY FIELD

BOUND MACHINE MOTION. KEEP THE CITY STEADY.

Physical AI commissioning geography / 可退出的城市调试地理

3 prototypes · 12 scenario cards · 90-day reversible pilot

Concept design · pending on-site baseline and statutory clearance

ONE LINE, NOT ANOTHER LAB

Place dynamic sources, transmission paths, stable receivers and unknowns on one reversible city base map.

CORE CLAIM

BOUND MACHINE MOTION SO INNOVATION DOES NOT MOVE THE WHOLE CITY

11.4 km²

D/T/S/U performance overlay

3

key-area prototypes

90 DAYS

reversible pilot + STOP drill

EVIDENCE GATE

Missing a real user, attributable conflict or written permission: remain at L0; build no new laboratory.

A PERFORMANCE GRAMMAR ABOVE STATUTORY LAND USE

D/T/S/U is not a new land-use code; it is a four-question overlay for planning Physical AI.

PERFORMANCE OVERLAY × PROVISIONAL BASE

- D

DYNAMIC: live machines, logistics, rail, plant

Register event, load, duty cycle and exit first.
- T

TRANSMISSION: structure, ground, joints, time

Measure the path before specifying isolation.
- S

STABLE: public service and precision receivers

Ordinary access and service cannot depend on a trial.
- U

UNMEASURED: unsurveyed, uncleared, unmodelled

Remain U; do not mask gaps with attractive thresholds.

D → T → S; if evidence is missing, classify U rather than force closure.

THREE DECISION PROTOTYPES, NOT THREE COPIES

One evidence rule: commission at Zhongzhiyuan, diagnose at AI Origin, classify unknowns first at Dazhongsi.

01

ZHONGZHIYUAN | MOTION YARD

Live machines run on D; T records structural transmission; S protects precision and public service; ordinary passage stays on the white bypass.

OPERATING LOOP

L0 record → L1 live trial → STOP → remove/scale

02

AI ORIGIN | STABILITY CLINIC

A mobile unit screens, repeats and refers. Engineering diagnosis starts only after a real conflict is established; no new fixed lab.

OPERATING LOOP

Book → screen → repeat → refer/close

03

DAZHONGSI | MOTION-STABILITY SECTION

Rail, existing structure and heritage remain U until cleared. One measurable section decides whether L1 is warranted.

OPERATING LOOP

Clearance → baseline → one conflict → decision

ORDINARY ACCESS ALWAYS STAYS OUTSIDE THE TRIAL

Layer the public bypass, equipment-return route, open-space strip and test core; on failure, preserve service before equipment.

NO PRESET WINNER, ONLY PREREGISTERED READINGS

Five public readings, five pilot segments and four implementation levels; readings decide whether to continue, not justify the concept.

01

TO MEASURE

CONFLICT EVENTS

What happened, who was affected, can it recur?

02

TO MEASURE

SERVICE CONTINUITY

Did the trial occupy the bypass or essential service?

03

TO MEASURE

REWORK + DOWNTIME

Did it reduce repeated tuning and idle shutdown?

04

TO MEASURE

STOP RECOVERY

How long to stop, take over, clear and restore?

05

TO MEASURE

MAINTENANCE + RETURN

Who maintains, how long, can the system fully exit?

90-DAY REVERSIBLE PILOT

STOP/REVIEW

L0: desktop record + permission

L1: low-risk live reversible pilot

L2: specify after independent repeat

L3: replicate only across multiple conflicts

EVIDENCE LADDER

01

SOURCE + PERMISSION

02

EVENT PREREGISTRATION

03

MATCHED BASELINE

04

AI VS NON-AI, EQUAL BUDGET

05

STOP / DELETE AI / SCALE

EVIDENCE-LED IMPLEMENTATION PROTOCOL

L0

records, permission, real user, on-site baseline

L1

90-day low-risk live trial; preregister five readings

L2

specify construction only after independent repeat

L3

replicate only across repeated conflicts with maintenance ownership

STOP CONDITIONS

- No real user
- No attributable conflict
- No written permission
- No service-continuity route
- No stable gain over non-AI baseline
