

The Pass Line

Jing-Zhang Pass Line

Before any AI service may enter a street, it must first pass a live walk-test on site across four use scenarios — children, elderly, accessibility, and caregivers. No clearance, no street.

01 · Five Sub-Gates Mechanism

Failure action is the core: clearance becomes a spatial institution with consequences, not another governance promise. Each sub-gate failure freezes the service and returns it to the sandbox.

02 · Three Key Areas × Three Gate Types

Zhongzhiyuan · Prototype Gate research_prototype_gate 192.1 ha Live verification before research-prototype AI services enter the street. New research lab + compute annex, retained heritage workshop.	Origin Community · Family Gate family_daily_gate 104.3 ha Kid Probe Line as clearance precondition (unique signature). Retained residential + community hub, new childcare & elder day-care.	Dazhongsi · Business Gate consumption_business_gate 72.0 ha Commercial AI must pass Accessibility Gate (wheelchair tester full route). New retail-AI complex + office tower, renovated market.
