

AI BELT • WINTER STRESS TEST

JINGZHANG WINTER WORKS

An AI Innovation Belt Stress-Tested by Winter

DELIVERABLE • A Winter Urban Operations Atlas for Beijing

Winter Atlas: Cold-Season Performance, Not Snow Scenery

Provisional extent · five evidence states · six layers · three conditions · eight works

SIX WORKING LAYERS

- Winter-solstice sun & shadow
- Wind/snow exposure (to test)
- First-clear routes & equipment
- Clean/polluted snow destinations
- Meltwater & night refreeze
- Services & industry validation

THREE CONDITIONS

- D0**
DRY COLD
- D1**
SNOW OPS
- D2**
MELT-REFREEZE

Every location awaits official geometry, survey, wind/drainage evidence, ownership, and operator sign-off.

Extent: organizer provisional polygon. Project nodes: conceptual search areas, not parcel, road, or engineering redlines.

JINGZHANG WINTER WORKS

One Atlas, Six Layers, Three Conditions, Eight Works

Every space must work under dry cold, snow operations, and melt-refreeze

THREE SCOPE LEVELS

YEAR-ROUND LOOP

D0 / D1 / D2 STATE MATRIX

	D0	D1	D2
Sun	● ●	●	●
Wind / snow	●	● ●	● ●
First clear	●	● ● ●	● ● ●
Snow storage		● ● ●	● ●
Meltwater	●	● ●	● ● ●
Services	● ●	● ● ●	● ● ●

AI = advisory warnings + work-order ranking after human confirmation + reproducible test logs; never automatic closures or safety sign-off.

This is an operating model, not a new zoning plan, institution, or technology-themed landscape axis.

JINGZHANG WINTER WORKS

Every node must work under D0 dry cold, D1 snow operations, and D2 melt-refreeze.

03 / KEY AREAS

AI BELT · WINTER STRESS TEST

Three Areas, Three Cold-Season Performance Sections

Shared D0/D1/D2 conditions; distinct spatial conflicts, validations, and stop rules

ZHONGZHIYUAN

Cold-stack validation

- Materials, tree pits, drainage, and devices share one record
- Lab → closed yard → limited public validation
- Robots are one test object, not the spatial concept
- Landmark: Freeze–Thaw Gauge

AI ORIGIN

Winter sun and existing buildings

- Hourly solstice sun + wind environment to be measured record
- Non-commercial seating–vestibule–shared-room gradient
- Normalize energy by weather and occupancy
- Landmark: Winter Sun Commons

DAZHONGSI

Wind-snow transfer and refreeze

- Canopy drip–wet shoes–interception–drying sequence
- Ramps, lifts, and buses enter the first-clear chain
- Warnings only suggest inspections; people confirm on site
- Landmark: Snow-Clear Hall

All wind, snow-drift, sun, flow, drainage, and massing claims await field measurement, models, and specialist engineering.

JINGZHANG WINTER WORKS

04 / SECTION

AI BELT • WINTER STRESS TEST

The First Route: Lock Accessibility, Drainage, and Fire Access First

Only remaining space can host equipment sweeps, manual clearing, snow storage, bikes, and loading

D0

Dry cold: sun, shelter, freeze protection

D1

Snow: equipment access, first clear, separation

D2

Melt/refreeze: drainage, night check, reopening

Relational section: no false dimensions. Formal 1:100–1:200 fit requires survey, equipment sweep, and professional review.

JINGZHANG WINTER WORKS

Warning → Reopening: Evidence and Human Veto

The goal is not zero risk, but traceable, reversible, repairable cold-season service

OPERATING EVIDENCE CHAIN

TEN ACCEPTANCE GATES

THREE CONTROLLED INDUSTRY TESTS

* Two hours is a proposal target, not a statutory sunlight standard. All targets require field baselines, specialist calculations, and operating budgets.

Not a new axis, but a shared operating map for getting the city through winter.

Official geometry, controls, survey, wind, snow, drainage, ownership, flows, equipment, and budgets are incomplete. This is a testable, reversible framework for professional development, not an approved design.
