

Smart Rail, New Pulse: Jingzhang Herringbone Line • Living Intelligence Spine

Using the century-old Jing-Zhang Railway herringbone as a spatial motif, the proposal organizes heritage, parkland, innovation, community, and AI public services into a walkable, interpretable, and reviewable innovation spine.

One belt • Two wings • Three key areas

Jingzhang Herringbone Line • Living Intelligence Spine

Overall design scope • three key areas • one spine + two wings • provisional world

Generated from submission GeoJSON and a provisional boundary; not an official redline or statutory control.

ETO-MQC • 2026

The Jing-Zhang Heritage Park becomes the north-south spine. The western wing carries Zhongguancun technology services, while the eastern wing carries Xiaoyue River scenario enablement. Zhongzhiyuan, Beijing AI Origin Community, and Dazhongsì respectively host indigenous innovation, talent origin, and AI-native industry.

Formal review ready
The four persisted gates — DETERMINISTIC_VALIDATION, SPATIAL_REVIEW, VISUAL_PACKAGING, and PROFESSIONAL_EVIDENCE — pass.

Material limitation: the site and three key areas are provisionally derived. Official polygons require full package recalculation; this is not a redline, regulatory plan, or implementation commitment.

Reviewable spatial and metric evidence

11.41 km²

Overall design scope (provisional boundary)

369.3 ha

Three key areas combined (provisional)

39.4 km

Road centreline total

19.8%

Green-space share

1.1%

Public-space share

12 / 5 / 3 / 8

Scenario cards / personas / landmarks / renewal projects

Three-level work framework

Level	Core question	Evidence anchor
Coordinated research	AI ecosystem and future urban form	Innovation chain, regional interfaces, standards matrix
Overall design	Renewal, mobility, utilities, character	Land use, buildings, roads, green space, phasing
Key areas	Detailed design and scenario pilots	Key-area polygons, public space, scenarios, implementation dependencies

Data discipline. FAR, height, building density, and statutory green ratio remain unknown. The proposal does not portray estimated values as approved indicators.

Spatial structure and decision gates

Before implementation: official boundary, regulatory plan, property rights, heritage, transport safety, utility interfaces, operator, and public feedback are all required.

The heritage spine becomes a shared active-travel, ecological, and intelligent-service framework

Transport and blue-green systems are not isolated. Rail transfer, active-travel continuity, stormwater, and public life are carried by the same reviewable layer set.

Design principles

Rail first • Active travel first • Heritage first • Low-impact renewal • Human service always remains available

Program structure

R&D + innovation Living + services Commerce + culture Green + open space Mixed use

Land use, conceptual buildings, and roads are generated from submission GeoJSON. Building footprints describe spatial strategy only; existing conditions, property rights, FAR, gross floor area, height, and density await official confirmation.

Mobility and blue-green network

Road centrelines, rail/water constraints, green space, and public space sit in independent layers. AI only assists navigation, maintenance, and interpretation; it cannot replace transport management, planning approval, or on-site human service.

Three stages of renewal

Each project needs property, formal control, heritage and safety, funding, operator, and public-feedback checks before it passes to its next stage.

Public-space component library

Component	Key provision	Operational baseline
AI Scenario Station	Bilingual wayfinding, booking bench, human help, paper guide	Works offline; no continuous individual-route collection
Heritage active-travel corridor	Viewing, shade, cycle stop, rain garden	Does not alter heritage or rail-safety limits
Station-front living room	Access, waiting, movable exhibit, carer facility	Fire, flow, and advertising permits first
Community micro-renewal pocket	Rest, exercise, family, notice, non-digital service	Community co-created; no marketing profile

Three key areas translate AI public value through spatial moves, pilots, and human fallback

Each scenario must answer who uses it, where it operates, which data it takes, who is responsible, and how it stops. AI is not a substitute for public services or urban management.

Pilot status
All scenarios below are conceptual proposals. Data classification, authorization, procurement/approval, cyber security, access, and human review come before activation.

Three key areas

Area	Position	Key move
Zhongzhiyuan	Full-stack autonomy + governance discourse	Qinghe innovation corridor, training/evaluation, standards and safety collaboration
AI Origin Community	World-class ecosystem + talent origin	Vertex plaza, open-source release, campus-park stitching
Dazhongsi	AI-native business + global exchange	Station-city living room, roadshow, device experience, data-elements parlor

Landmarks and heritage resource

“See the rails, remember the history, feel the future.”

AI Origin Plaza, the Jingzhang Intelligence Spine Bridge/Walk, and the Dazhongsi Station-City Living Room are three conceptual landmarks. Recognition displays only use transparent categories — open-source contribution, public service, and accessible co-creation. Enterprise or university names, logos, work, and personal data require authorization before display.

Three conceptual test scenarios

Scenario	TRL / metric	Space and exit condition
Automated active-travel navigation	TRL 6; suggested accuracy ≥95%, latency ≤200ms	Heritage spine about 8 km; halt prompts and revert to static signs/human help after abnormality
AI public-space maintenance	TRL 5; suggested detection ≥90%, response ≤30min	Qinghe, station fronts, and stations; shrink if cost/false alerts fail; manual inspection primary
Data-compliance circulation sandbox	TRL 4; zero confirmed leakage, 100% audit completeness	Concept node in Zhongzhiyuan; freeze and human-review after legal or consent change

Inclusive design and five user groups

Children: safe play and carers' sight lines. Older people: rest, access, and human service. Disabled users: continuous route, tactile paving, audio navigation, and accessible washrooms. People facing digital exclusion: paper guides, on-site help, and non-smart-device service. Carers: feeding and family toilets. Every space and algorithm deployment requires on-site access and public-experience review.

Clear rights, auditable operation, and exit mechanisms underpin lasting brand governance

Jingzhang Herringbone Line • Living Intelligence Spine is a visible concept VI, not a government emblem or registered trademark. Every brand and scenario use must be authorized, logged, and reviewed.

Rights and sources
All external cases are used for factual verification and mechanism comparison only. No third-party images, drawings, logos, font files, or data screenshots are downloaded, embedded, or redistributed.

Visible identity system

Rail Blue, Spine Green, Signal Orange, Node Red, and Warm Paper form the palette. Wayfinding, the Spine Pass, scenario-opening platform, and Living Intelligence Week are reviewable conceptual prototypes.

Global cases: mechanisms only

Case	Mechanism	Use boundary
Toronto Quayside	Public realm + development partner	No renderings or data reproduced
Seoul Smart City	Inclusion, public benefit, safety, participation	No DMC replication or visual reuse
Punggol Digital District	Industry-academy-community + operating data	No JTC plans or images redistributed
London Knowledge Quarter	Multi-institution collaboration + dashboards	No dashboard data or screenshots shared
Qianhai	Cross-regional interface governance	No protected content republished; no partnership claim
Shibuya Stream	Rail remnants, river, square, mixed use	No copyrighted images/drawings reused

Annual activity and developer community

Module	Cadence	Governance and conversion
Living Intelligence Week	Annual results release, public experience, accessible co-creation, and outreach	Open rules, event safety, partner authorization; issue call to compliant pilot match
Developer community	Monthly exchange, quarterly open-source maintenance, annual public-problem challenge	Open-source licence, IP, conduct, data minimization; authorized pathway to incubation/training/procurement
Scenario operations	Submit → risk screen → small sandbox → independent review → expand or exit	Advance only after safety, public-interest, and feasibility review

Rights, status, and next steps

Unified status: ready_for_review, with four blocking gates persisted and passed. This only means the package can enter formal review; it does not mean gallery publication, award selection, implementation approval, or government endorsement.

Next steps: After official boundary, key-area polygons, regulatory plan, property, utility, heritage, and public-service data arrive, recalculate geometry, metrics, figures, HTML, and PDFs. Authorized Chinese/English reviewers must sign the substantive-equivalence register; confirm partners, events, trademarks, fonts, and third-party sources item by item.

Registers: report/rights_ledger.md and report/bilingual_equivalence.md.
