

Jing-Zhang Proof Gardens

Every AI pilot leaves better public ground, auditable evidence, human fallback, and a stop condition

Design Basis and Source List

This proposal treats the AI Innovation Belt first as a public verification institution and only then as an industrial image. Any AI pilot entering public space must leave four reviewable outcomes: a visible improvement to public ground, an auditable evidence card, a human fallback that can be used immediately, and a stop condition written in advance. These rules form one public experiment spine, three proof gardens, a two-wing collaboration network, and twelve everyday test beds. This is neither a government commitment nor an approved control plan. It is an urban-design and operating proposal ...

Three-Level Scope Framework

The strategic study scope answers who collaborates with whom: university research, open-source collaboration, enterprise validation, public adoption, and international communication form an AI ecosystem chain tested against seven global cases. The overall design scope answers how collaboration enters the city: one spine, three gardens, two wings, and twelve test beds organise land use, walking, blue-green systems, new infrastructure, and events. The key areas answer where risk is contained: Zhongzhiyuan validates technology, Beijing AI Origin organises shared learning, and Dazhongsi tests adop...

Coordinated Research Area: Industry and Future City Research

Jing-Zhang Proof Gardens translates the memory of a century-scale linear infrastructure from transport efficiency into the way public knowledge is carried, tested, and repaired. The mark is made from four open cells representing public improvement, evidence, human fallback, and a stop condition. Paths remain between the cells so the AI district does not resemble a sealed chip. The identity uses graphite, chalk, mineral green, and a single vermilion accent. Green belongs to public ground; vermilion marks a review threshold and never becomes a technological glow. The identity becomes four physic...

Overall Design Area: Urban Renewal and Regulatory-Plan-Level Urban Design

The overall structure is one spine, three gardens, two wings, and twelve test beds. The public experiment spine follows the long direction of the provisional corridor and indicates continuity for walking, cycling, rainwater, wayfinding, and events. It does not replace the actual Jing-Zhang railway-heritage park boundary. The three gardens contain higher-risk tests. The two wings are not additional development strips; they are relationships that existing institutions could form through shared opening hours, reciprocal services, and safer crossings. Twelve small, reversible installations host th...

Detailed Design of Key Areas

Zhongzhiyuan carries the role: prove that technology is controllable before it enters the city. The garden combines a public observation walk, isolated test sheds, a Failure Specimen Grove, and a low-carbon compute passport desk. Professional teams may run model red-teaming, edge-compute, and low-speed embodied-AI tests in contained settings. The public sees the task, permission, energy band, human takeover, and stop reason without access to sensitive inputs. Shade and rain gardens turn waiting, discussion, and observation into public space rather than an enterprise showroom. The quantified co...

AI Innovation Ecosystem, Personas, and AI+ Scenarios

Six personas test the proposal together: open-source developer, startup validation lead, university researcher or student, resident and caregiver, front-line public-service worker, and international visitor or event organiser. Personas are not commercial recommendation labels and never enter facial recognition or individual tracking. They only test whether spaces provide collaboration, exit, care, human takeover, bilingual access, and accessibility at the same time. Twelve scenario cards cover accessibility auditing, slow-mobility conflict, rain-garden maintenance, bilingual service, education...

Land Use, Building Scale, and Retain-Renovate-Demolish Strategy

Land use uses the project subset of the national spatial-use classification, forming a complete partition of research, education, housing, community service, commercial service, roads, green space, and squares. The geometry is a rule-based division of the provisional site used to test allocation and topology. It is not a claim about existing parcels or statutory use. Every colour in the figure resolves to a land_use_code, and its area is recomputed in EPSG:4548. Buildings are capacity test fits only. Four conceptual footprints in each key area host testing, shared learning, repair, or service ...

Mobility starts with continuous walking before smart transport. The public experiment spine carries a north-south path, while six conceptual east-west links identify crossings between campuses, parks, and neighbourhoods that deserve priority review. They are not road redlines or engineering alignments. Each link first passes an accessibility co-audit, conflict observation, and night-lighting pilot before entering engineering design. Connections associated with Dazhongsi Station must wait for correction of PROV-KEY-003. The blue-green system combines linear shade, rain gardens, and the open gro...

Blue-Green Network, Public Space, and Urban Character

Mobility starts with continuous walking before smart transport. The public experiment spine carries a north-south path, while six conceptual east-west links identify crossings between campuses, parks, and neighbourhoods that deserve priority review. They are not road redlines or engineering alignments. Each link first passes an accessibility co-audit, conflict observation, and night-lighting pilot before entering engineering design. Connections associated with Dazhongsi Station must wait for correction of PROV-KEY-003. The blue-green system combines linear shade, rain gardens, and the open gro...

Renewal Projects, Implementation Policy, and Phasing

Nine projects follow evidence first, connection second, and scale last. Near-term work tests public benefit through temporary markings, accessibility audits, three lightweight garden demonstrators, and operating protocols. Mid-term safe crossings, rain gardens, wayfinding, and edge-compute nodes proceed only after roads, utilities, fire, and ownership are confirmed. Official spatial data triggers package-wide recomputation as soon as it is released. Phasing polygons cover the provisional site for topology checking only and do not represent a public investment timetable. The proposal assigns no...

Metrics, Area Recalculation, and Compliance Matrix

Risk, Copyright, and Compliance

The proposal, translation, nine GeoJSON layers, metrics, assumptions, sources, three matrices, self-check, five bilingual figure pairs, A3 booklets, A0 boards, report HTML, offline interactive visual, cover, and short film come from one generation state. Figures and PDFs use only submission data, code-drawn graphics, and one original cover base generated for this task. There are no remote fonts, CDNs, map tiles, iframes, trackers, or forms. The silent film does not autoplay and includes Chinese and English VTT, posters, and transcript; the Canvas is keyboard operable and honours reduced motion...

The seven cases provide mechanism background, not transferable performance. Punggol suggests university-industry co-location; Kalasatama, short co-created pilots; Seoul, a distributed service network; Mila, intersections among research, policy, and making; Knowledge Quarter London, a common identity for existing institutions; Paris-Saclay, circular economy and a network of innovation places; and Kendall Square, a shift from innovation park to innovation community. Every case uses a first-party page from an operator, government, or public development agency. Access date, rights boundary, and us...

Mechanism translation from seven cases

Case	Mechanism	Local translation
Punggol Digital District, Singapore	Co-locates university, industry, and a public development platform so learning, R&D, and the Zabitong walking garden shares everyday past grounds and a public review walk; no district scale, job, or investment figures are transferred.	
Smart Kalasatama, Helsinki	Runs short agile pilots with residents, companies, researchers, and the city, recording a future open public hearing and resident review day keep pilots small and reversible before any scale-up discussion.	
Seoul AI Hub	Uses distributed facilities and staged programmes for education, incubation, compute, and the time of concepts and co-validation is shared learning, and adoption-repair into complementary rather than duplicated services.	
Mila, Montreal	Interweaves research community, industry partnerships, venture support, policy capacity, and the original Techmaking Space links campus and community through open-source tables, a policy clinic, and low-barrier making space.	
Knowledge Quarter London	Connects existing cultural, academic, research, community, and local-government institutions through shared wayfinding, open hours, and a contribution ledger.	
Paris-Saclay	A public development agency combines urban experimentation, circular economy, a new repair, of interactions placed, and annual a proof of concept become spatial-operational themes without promising an implementing agency or funding.	
Kendall Square, Cambridge	Shifts from an innovation district to an innovation community through connected open space, public experiments, and a district coordination working armature; enterprise display must face the street and deliver a benefit usable by ordinary residents.	

Twelve scenario cards

ID	Scenario	Host	Boundary
SC-01	Co-audited accessible route	Public experiment spine	Residents, wheelchair users, and maintainers mark barriers together; AI aggregates issues without tracking individuals.
SC-02	Slow-mobility conflict observatory	Cross-street links	Anonymous manual counts and short-term sensors compare walking-cycling conflicts; raw data is deleted when the test ends.
SC-03	Rain-garden maintenance assistant	Blue-green nodes	Flags dryness, blockage, and planting damage; maintainers verify before dispatch and no automatic irrigation changes are allowed.
SC-04	Bilingual community-service explainer	Community-service frontage	Turns public service information into plain Chinese and English while retaining a staffed counter and paper guide.
SC-05	Education-health-legal referral desk	Origin Commons Garden	Provides public institutions and booking routes only, with no diagnosis, legal opinion, or eligibility decision.
SC-06	Open-source release and reproduction table	Open-source Canopy	Releases include data licence, model card, reproduction steps, and known failures; contributions enter a reversible honour ledger.
SC-07	Public model red-team gallery	Zhongzhiyuan Bench Garden	Professional red teams work in isolation while the public sees methods and findings rather than sensitive inputs.
SC-08	Low-carbon edge-compute passport	Proof node	Records task type, energy band, and shutdown condition without exposing proprietary model details.
SC-09	Intelligent-device repair library	Dazhongsi Repair Beacon	Offers inspection, borrowing, updating, and recycling routes, with repair before replacement as the default.
SC-10	Low-intrusion night route	Public experiment spine	Lighting responds by time and aggregate footfall; emergency calls reach people first and facial recognition is excluded.
SC-11	Data licence and exit clinic	Adoption and Repair Garden	Helps teams document data origin, exit mechanism, appeal route, and deletion responsibility.
SC-12	Global AI Proof Season	One belt and three gardens	A one-week public walking review links trials, resident juries, open-source releases, and a failure archive.

Sources, assumptions, and rights

Complete machine indexes are in sources.json, assumptions.json, the three matrices, and self_check.json. Temporary geometry cannot support precise areas, statutory controls, or station engineering. The cover base was generated for this task with the built-in OpenAI image tool; figures and layouts are generated locally.
