

Urban Field Dynamics

Shape the conditions under which the city evolves, not one prescribed end state

Method and evidence chain

Evidence chain: models cannot upgrade source authority

From evidence status to reviewable strategy, retaining gaps and human gates

Current smoke is synthetic redevelopment qualification, not a Haidian forecast.

Scopes, timescales, and key areas

Three scopes × four timescales

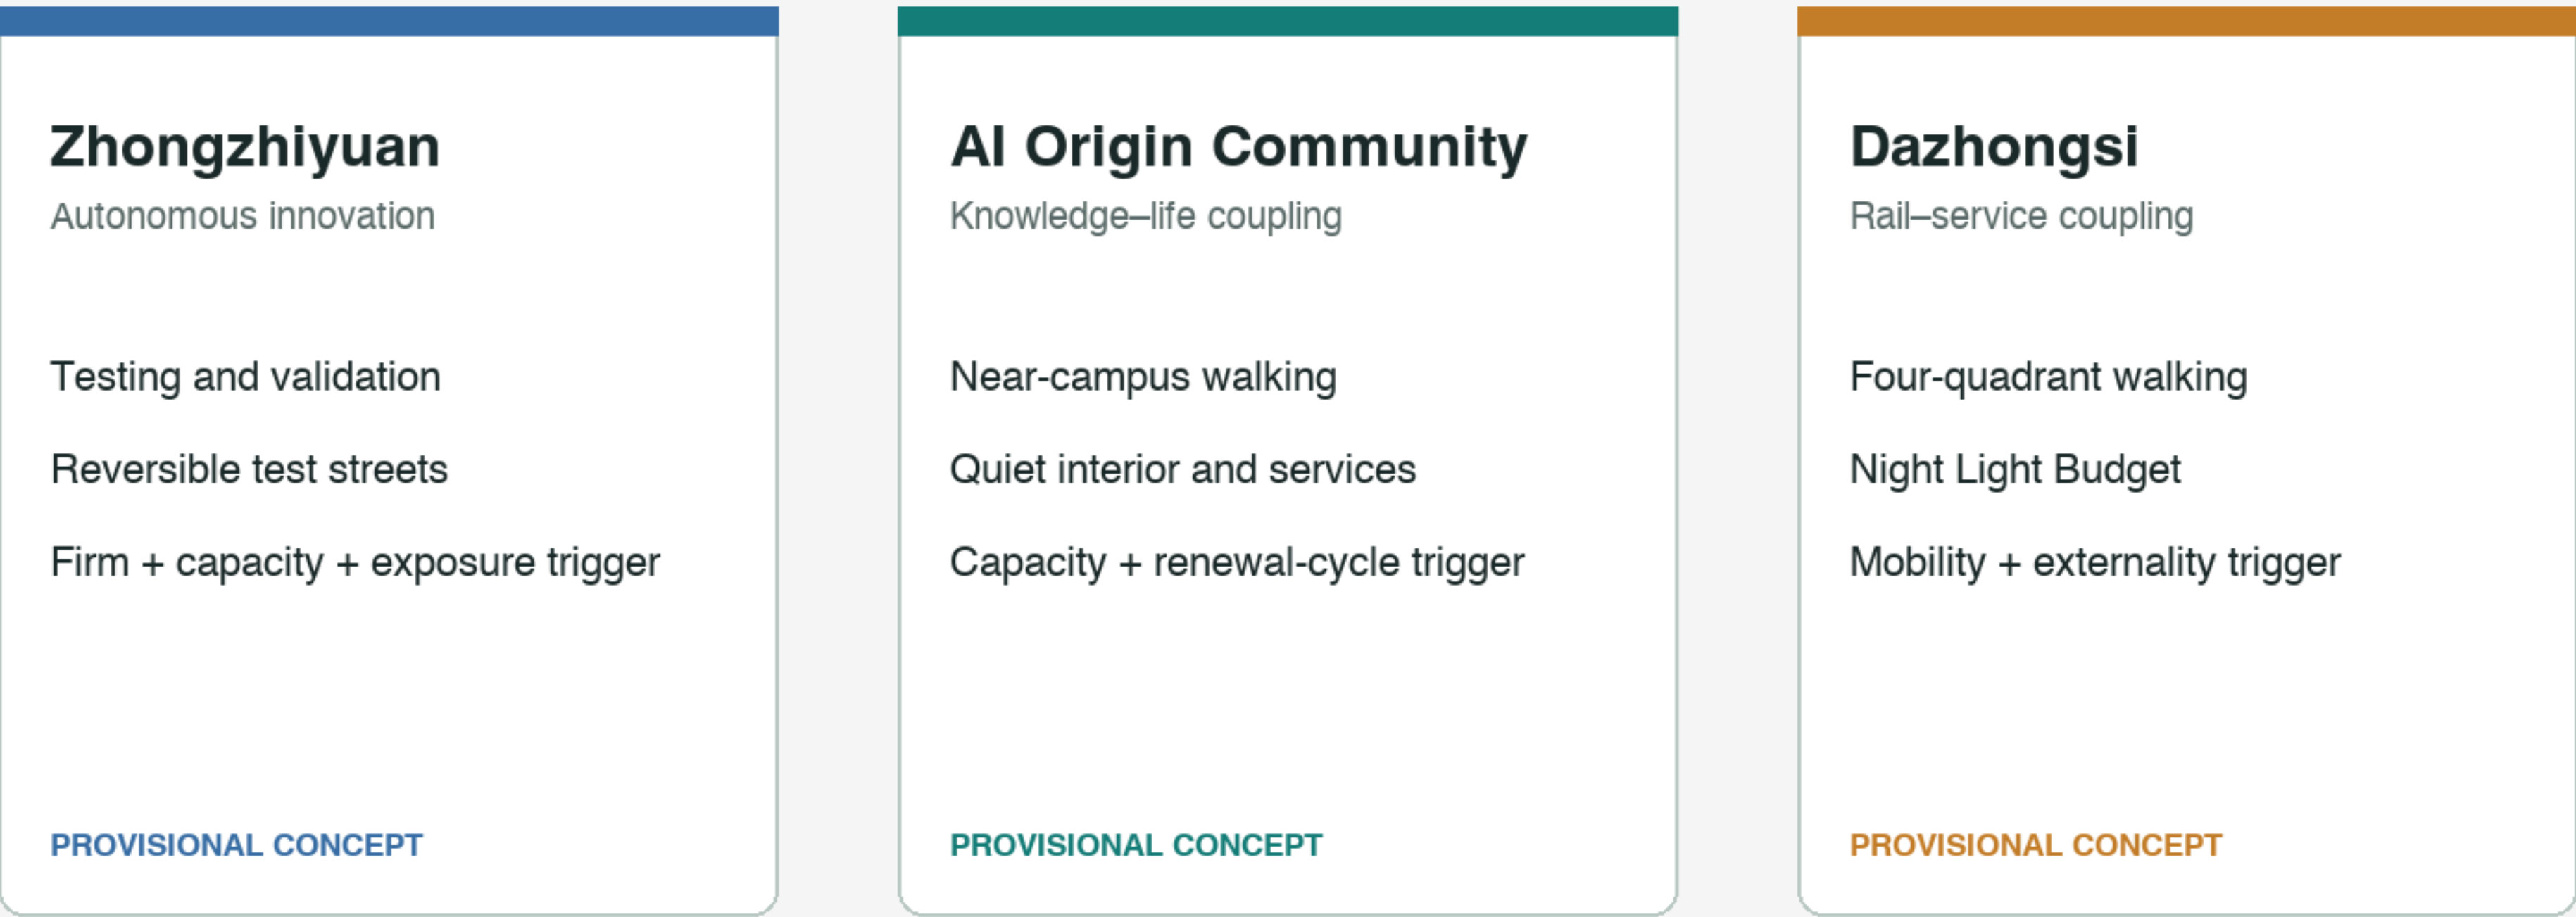

Shared state contract without shared false precision

Observers read emergent morphology; morphology is not an objective.

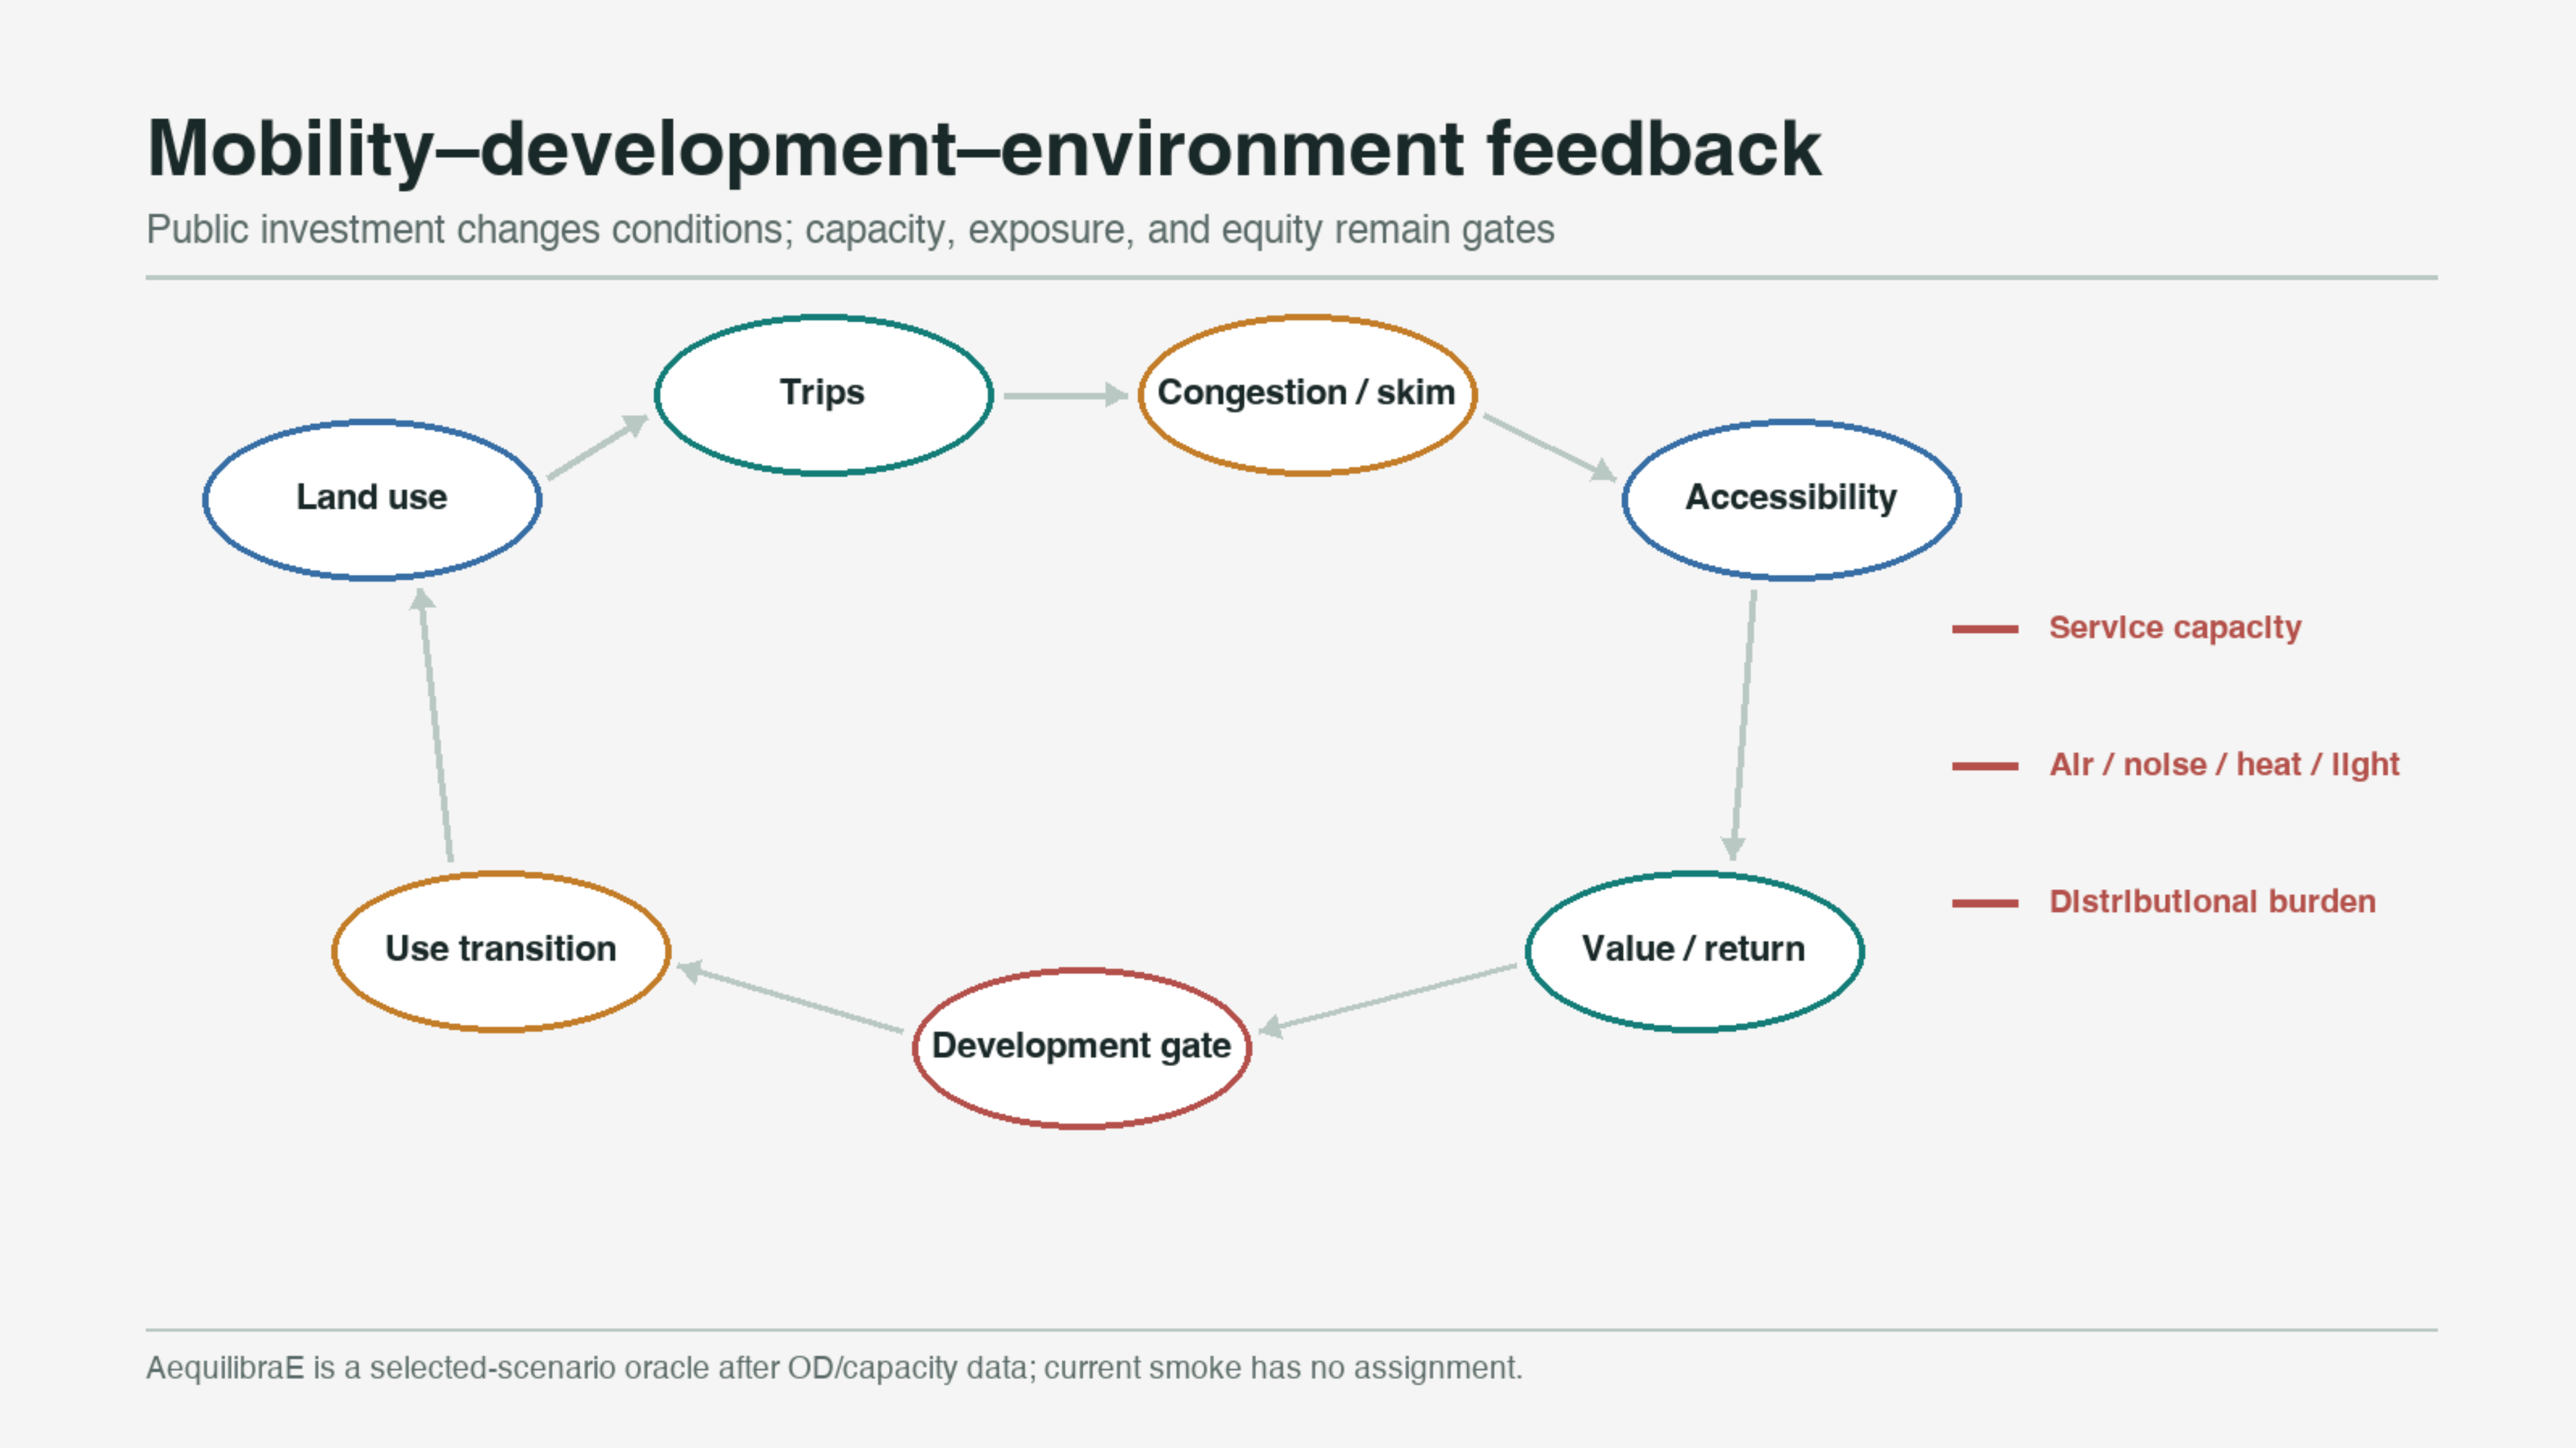

Three key areas: conditions, actions, triggers

Do not pre-load three centres; require mechanisms to support coordination

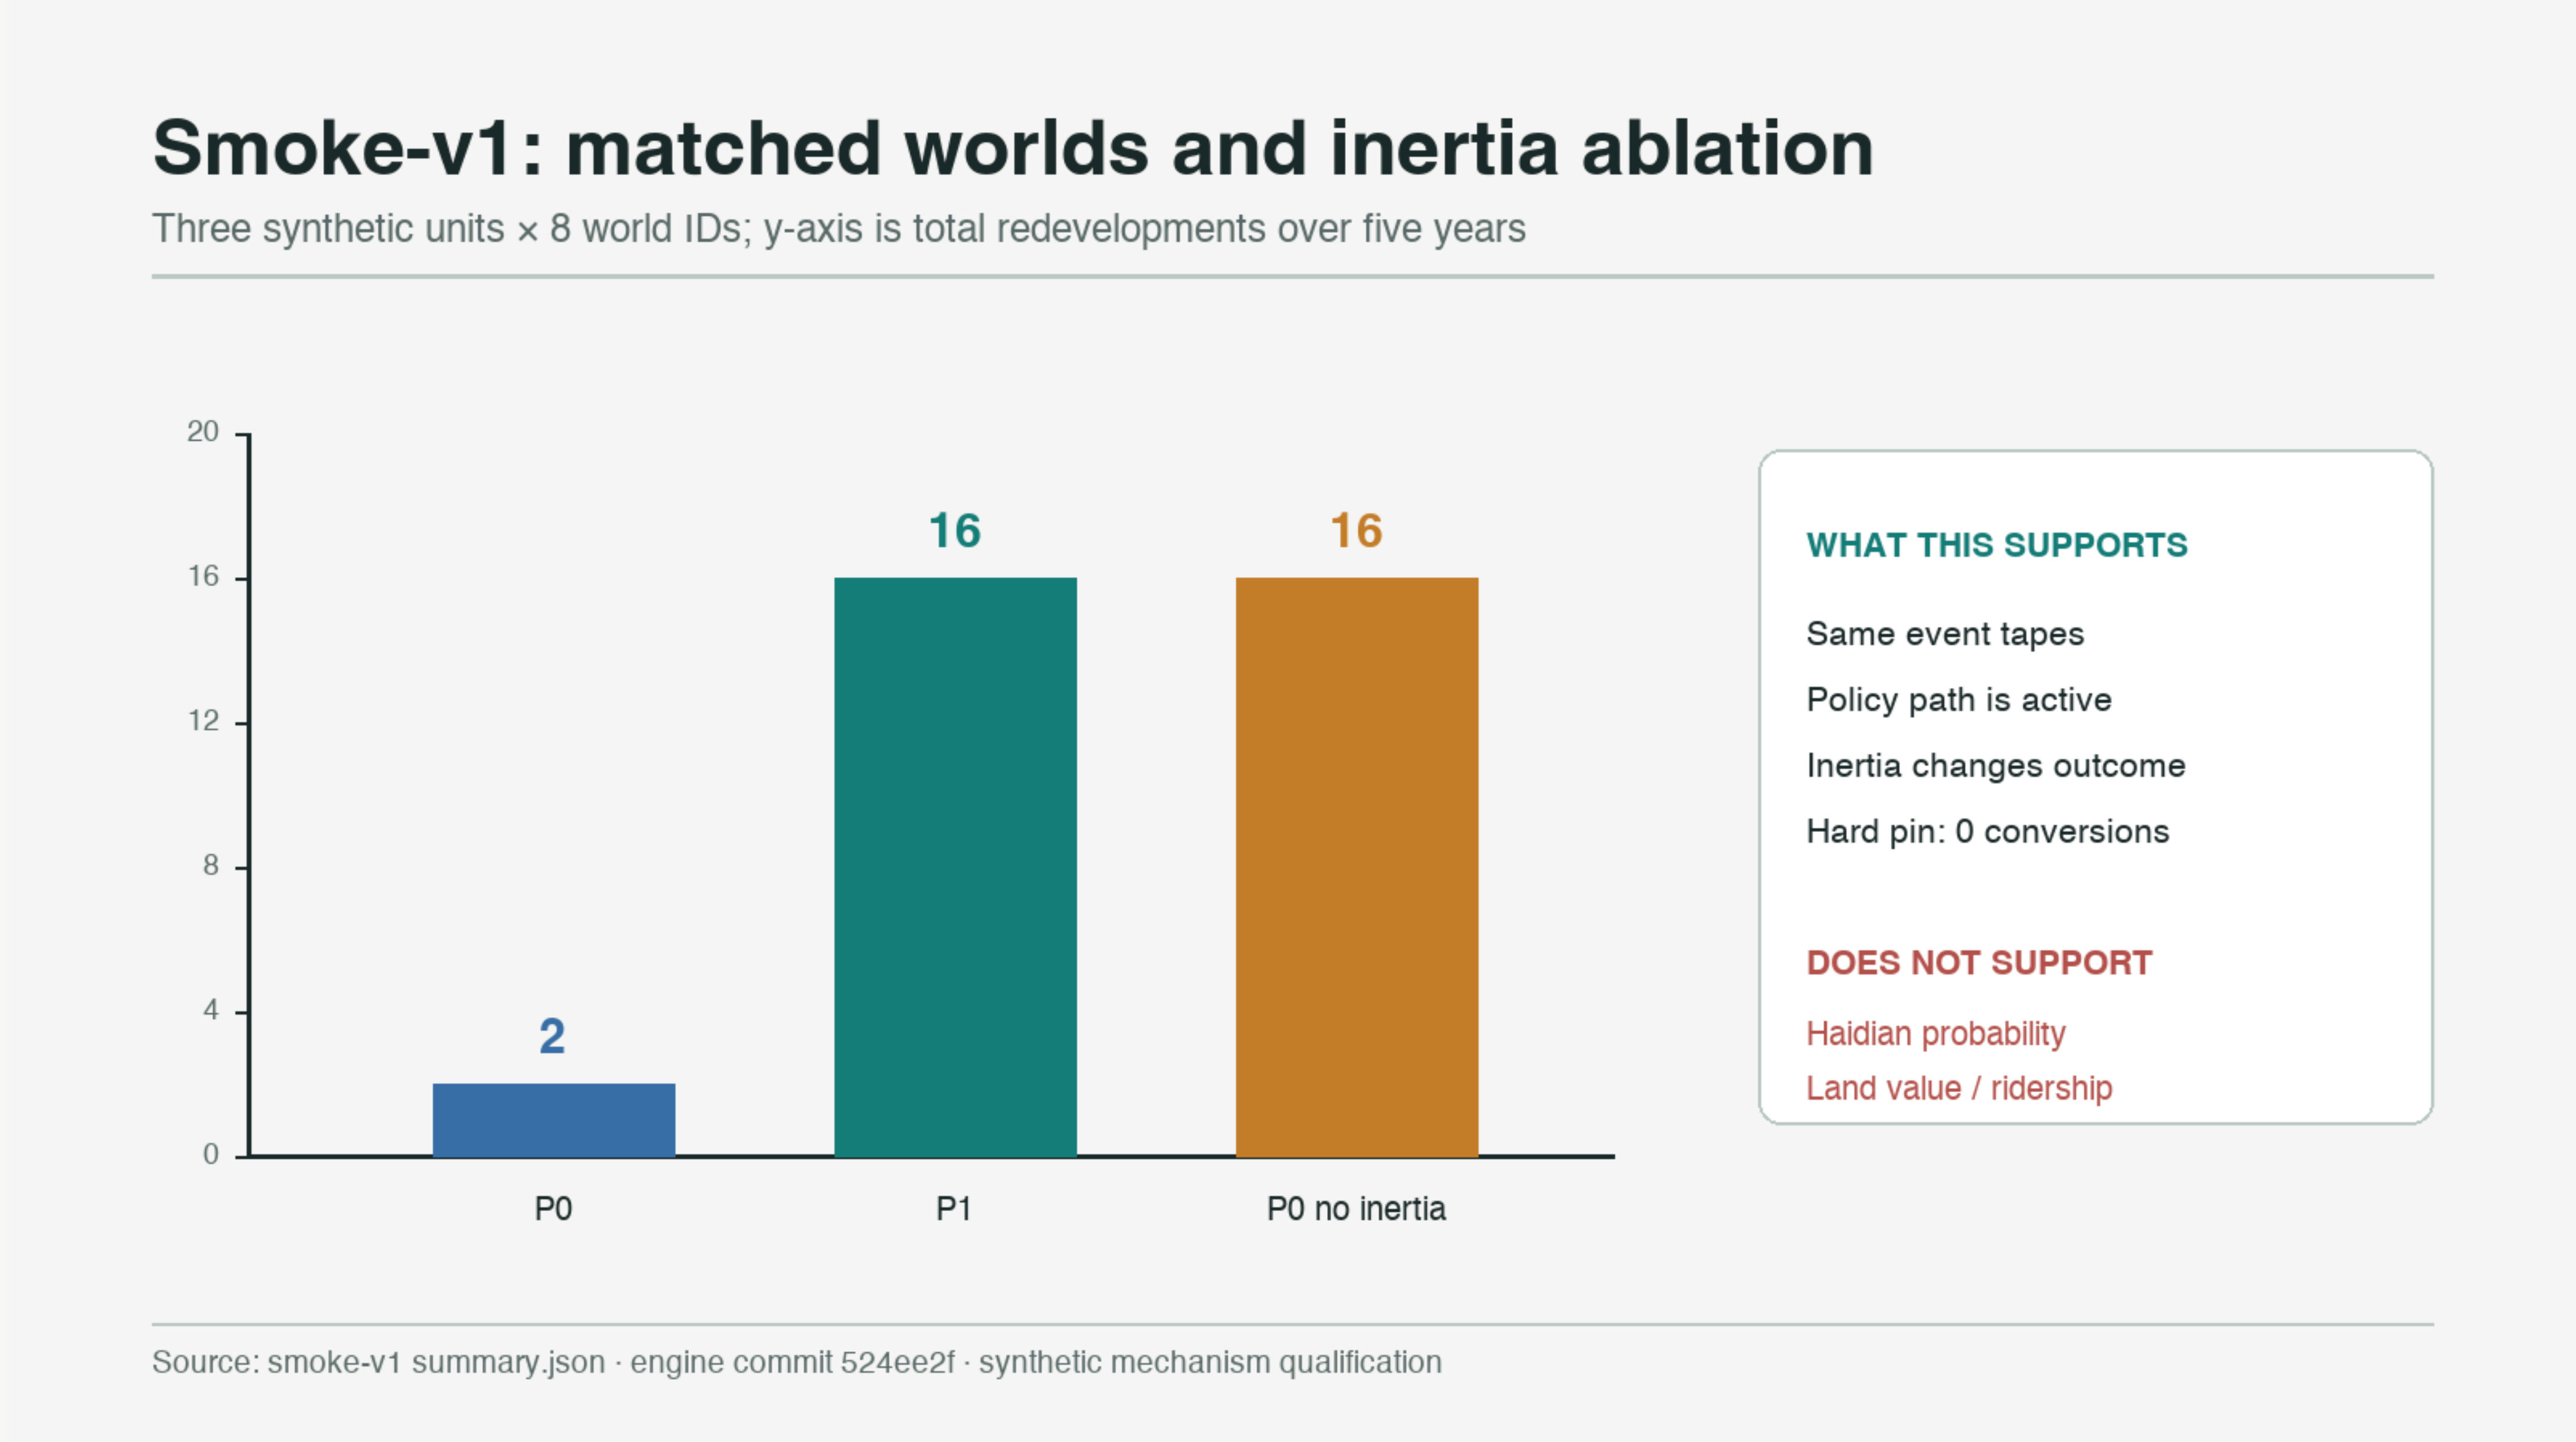

Recalculate after official polygons, buildings, ownership, and specialist controls arrive.

Mobility - development - environment feedback

Commitment: no-regret backbone and hard protection
Optionality: low-cost reversible trials
Trigger: pre-declared rules to scale, wait, or exit

The current 2 / 16 / 16 result is synthetic mechanism qualification only. It is not a Haidian probability, value, ridership, or statutory metric.

Implemented: strict contracts, Philox event tapes, transition inertia, P0/P1, eight matched worlds, a no-inertia ablation, and full replay verification.

Not yet implemented or calibrated: complete household/firm dynamics, traffic assignment, environmental fields, service capacity, and real policy search. Official polygons, buildings, ownership, OD, capacity, and historical transitions are missing.
