

Urban Field Dynamics

Shape the conditions under which the city evolves, not one prescribed end state

We do not optimise the city. We optimise the conditions under which the city evolves.

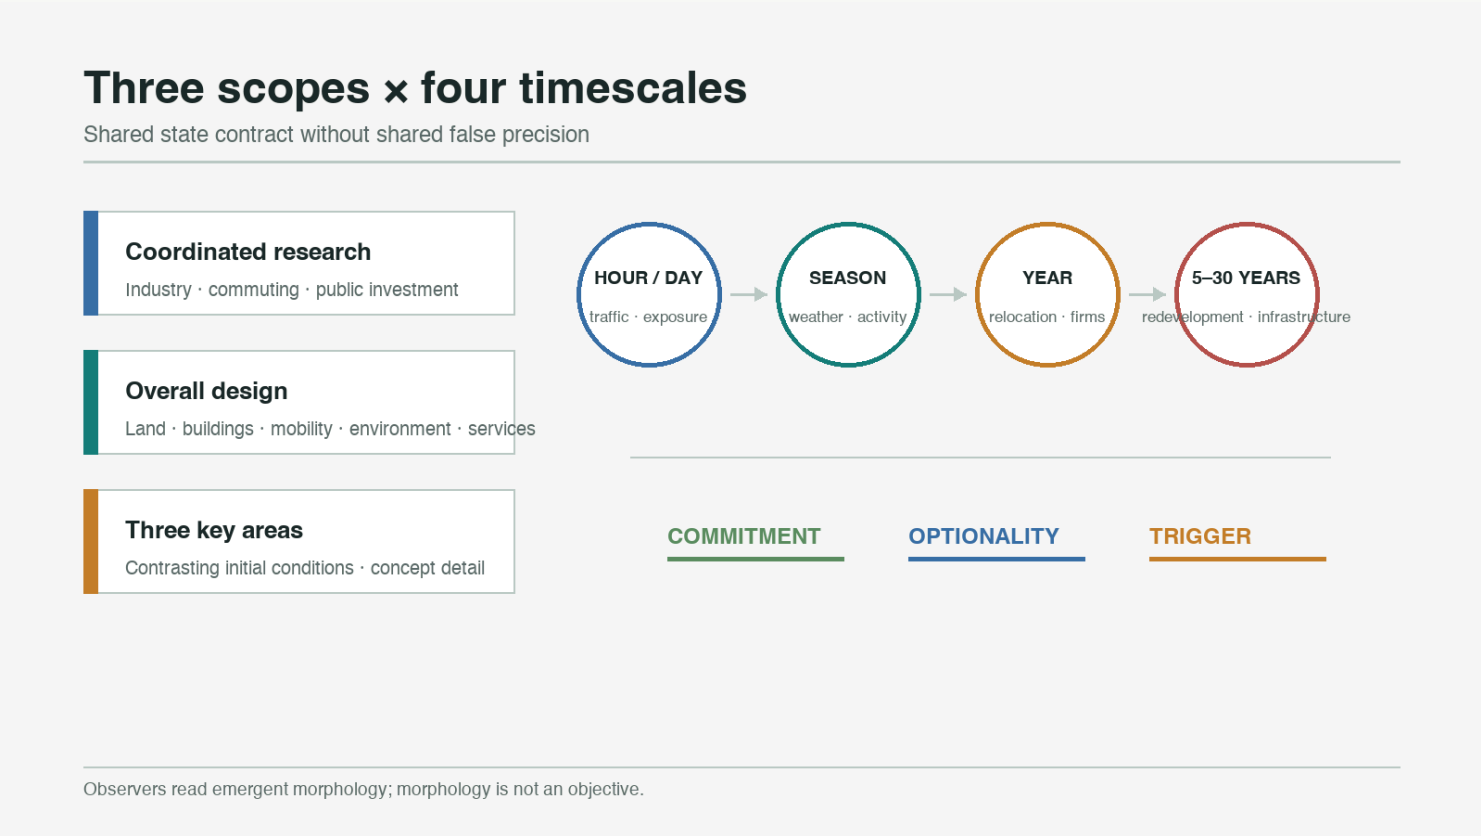

Evidence chain: models cannot upgrade source authority

From evidence status to reviewable strategy, retaining gaps and human gates

Current smoke is synthetic redevelopment qualification, not a Haidian forecast.

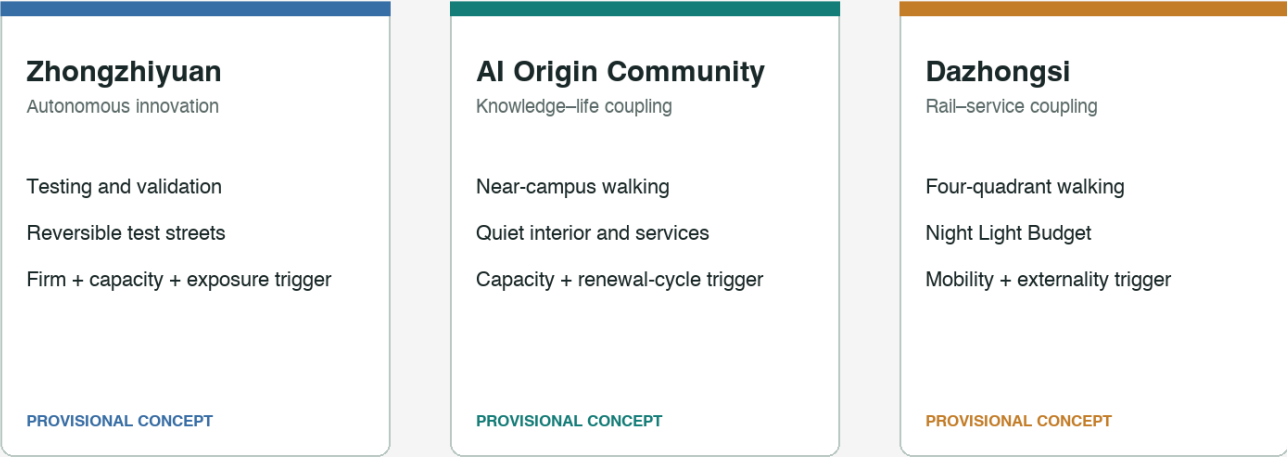

Scopes, timescales, and key areas

Official geometry and professional controls remain replacement inputs.

Three key areas: conditions, actions, triggers

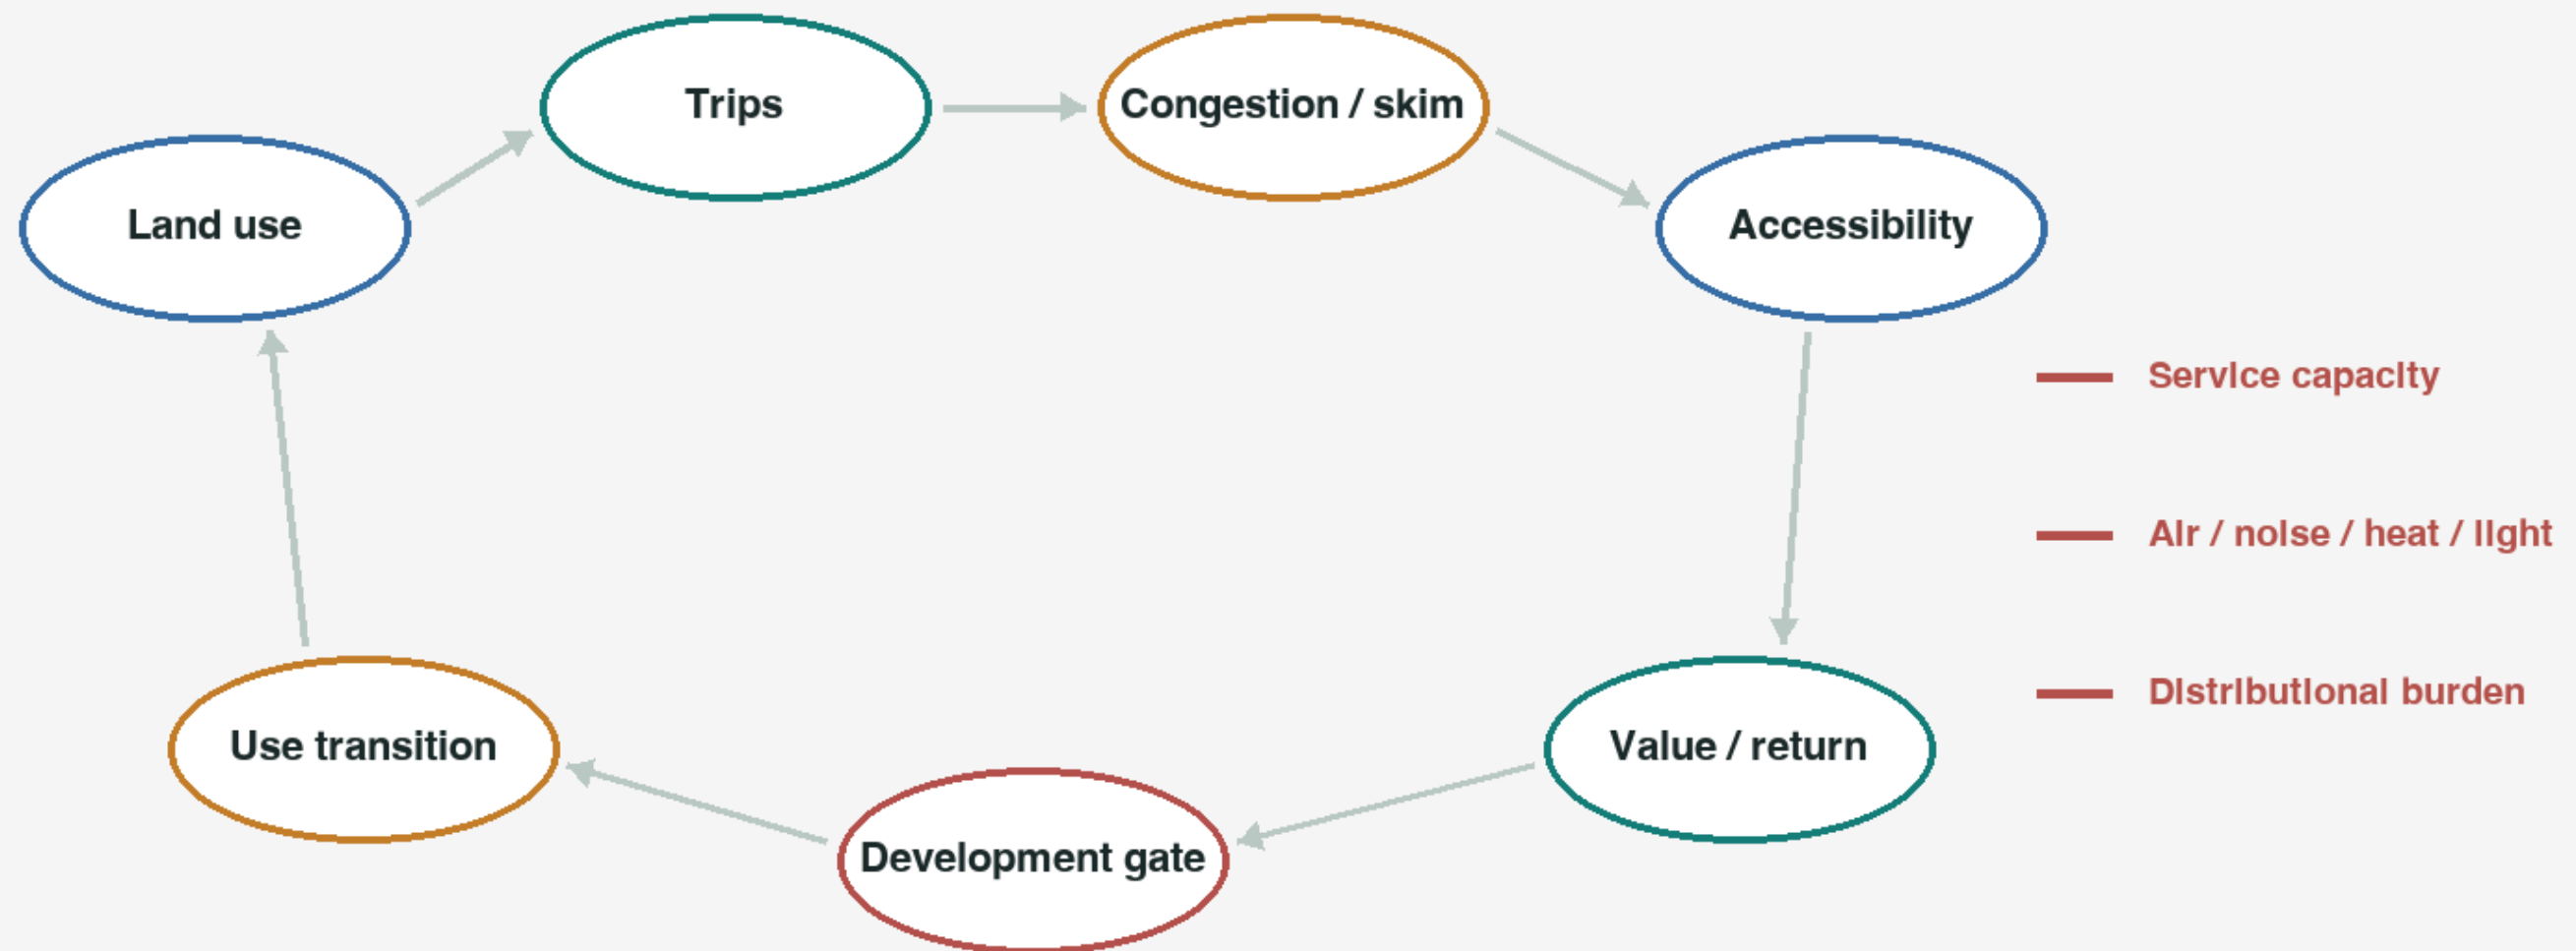

Do not pre-load three centres; require mechanisms to support coordination

Mobility - development - environment feedback

Mobility–development–environment feedback

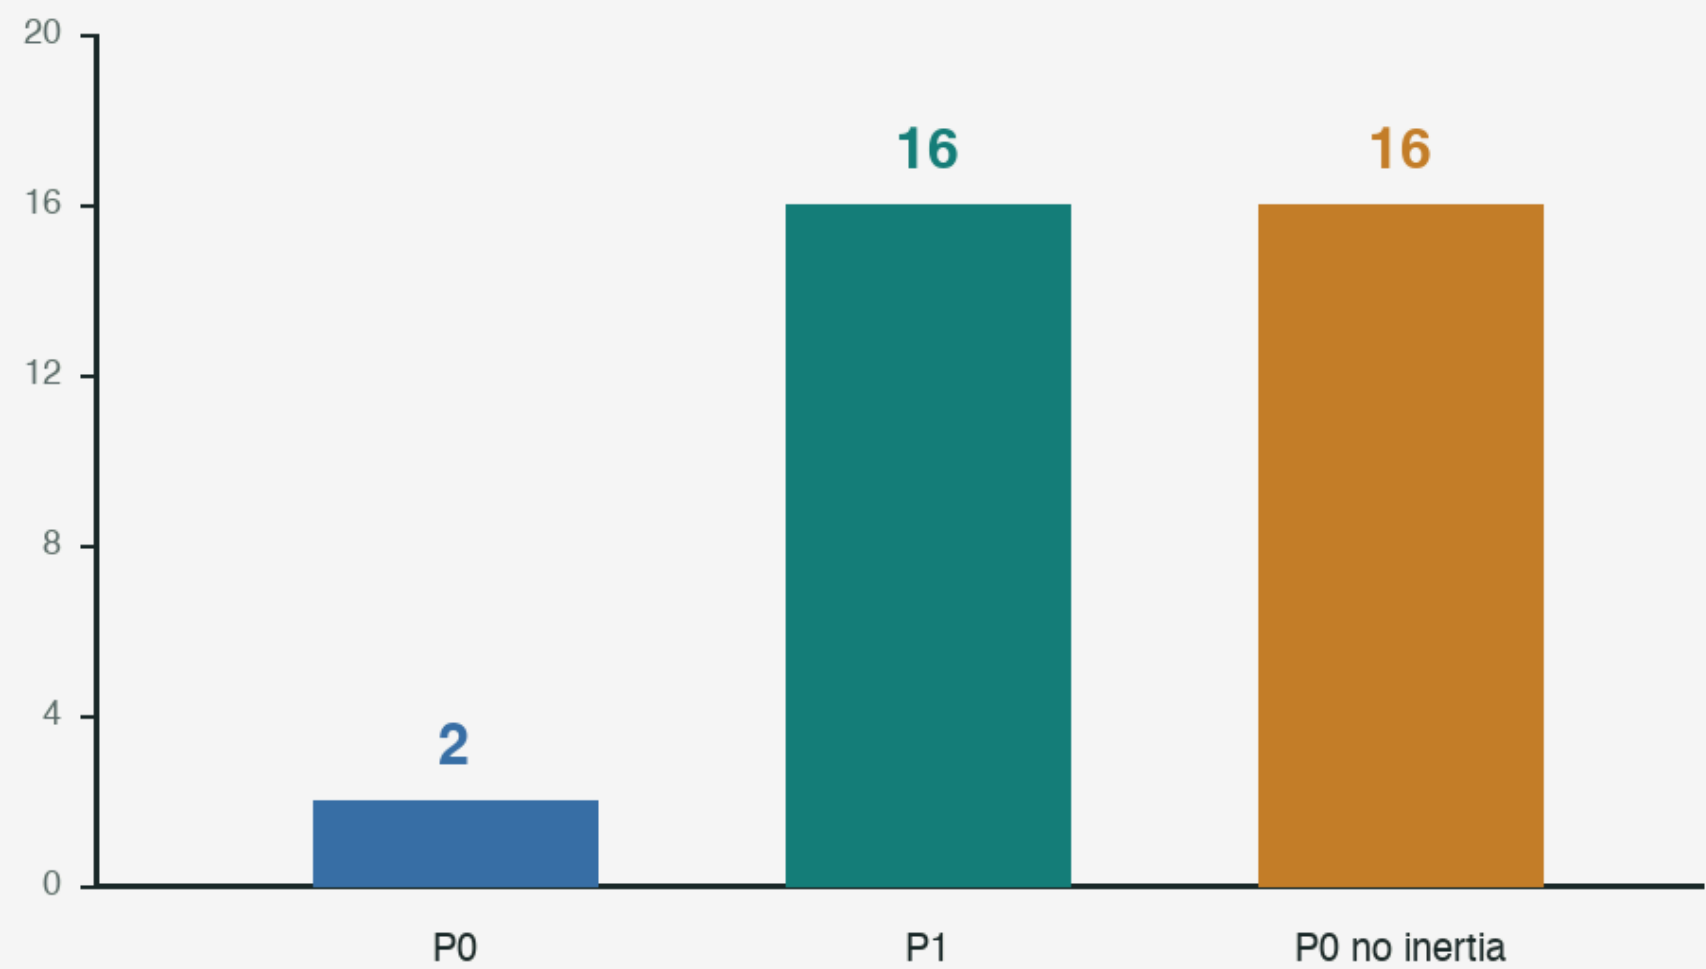

Public investment changes conditions; capacity, exposure, and equity remain gates

AequilibraE is a selected-scenario oracle after OD/capacity data; current smoke has no assignment.

Smoke-v1: matched worlds and inertia ablation

Three synthetic units × 8 world IDs; y-axis is total redevelopments over five years

WHAT THIS SUPPORTS

- Same event tapes
- Policy path is active
- Inertia changes outcome
- Hard pin: 0 conversions

DOES NOT SUPPORT

- Haidian probability
- Land value / ridership

Commitment / Optionality / Trigger

Commitment: no-regret backbone and hard protection	Optionality: low-cost reversible trials	Trigger: pre-declared rules to scale, wait, or exit
---	--	--

Implementation boundary

Implemented: strict contracts, Philox event tapes, transition inertia, P0/P1, eight matched worlds, a no-inertia ablation, and full replay verification.

Not yet implemented or calibrated: complete household/firm dynamics, traffic assignment, environmental fields, service capacity, and real policy search. Official polygons, buildings, ownership, OD, capacity, and historical transitions are missing.

The current 2 / 16 / 16 result is synthetic mechanism qualification only. It is not a Haidian probability, value, ridership, or statutory metric.
