Three-Level Scope Framework

The proposal organizes work across three levels determined by the official announcement, with each level implementing and cross-checking the others. The coordination research scope informs industry chain and urban form decisions; the overall design scope translates these into renewal projects and spatial structure; the key area scope validates implementability at the parcel level.

Core Translation

The core translation is "One Track, Three Stations, Two Wings" — one track is the Jingzhang Heritage Park AI Innovation Axis running north-south; three stations are Source Station (Multi-Wisdom Park · 192.1ha · Basic Research), Core Station (AI Origin Community · 104.3ha · Innovation Ecosystem), and Market Station (Dazhongsi · 72.0ha · Industry Application); two wings are the Zhongguancun IP Wing (East · Capital & IP Enablement) and Xiaoyuehe Scenario Wing (West · AI Scenario Testing & Urban Life).

Design Basis and Data Inventory

This proposal is based on the "International Design Competition Pre-Qualification Announcement for the Centennial Jingzhang AI Innovation Belt" issued by the Haidian Branch of the Beijing Municipal Commission of Planning and Natural Resources, the open-source agent-oriented task brief, and machine-readable site data registered by maintainers.

Data inventory shows: 5 formal-ready sources, 0 background sources, 1 provisional-only source. The announcement and task brief are formal-ready and can directly support design decisions; provisional-only data serves only as background reference and cannot be elevated to official boundaries, statutory plans, or government implementation commitments.

Data Gaps

Official site boundary, official key area polygons, regulatory plan conditions, existing building ownership, road red lines, municipal utilities, heritage protection boundaries, and public service facility data are still missing. All area values are provisional estimates, subject to recalculation upon official data release.

Naming System and Intelligence Track Concept

The proposal is named "Jingzhang Intelligence Vein · Centennial New Track" (JZ-AIV). The core metaphor transforms the Jingzhang Railway's "iron track" into an "intelligence track" — an AI innovation corridor connecting past and future, engineering and intelligence, culture and life.

In 1909, Zhan Tianyou led the construction of China's first independently designed mainline railway. Its engineering innovation spirit finds new spatial expression in the 2026 AI era. The naming system follows "one track, three stations, two wings" — three stations correspond to the "source-core-outlet" segments of the innovation chain, retaining the railway "station" imagery while■■ AI semantics.

Logo Design Direction

Fusing the Chinese character "track" with circuit board patterns: horizontal lines serve as both rails and data buses, vertical lines as both sleepers and chip pins. Primary color is Jingzhang copper, secondary is AI blue, accent is eco green.

Three-Area Two-Wing Coordination Circuit

The three areas and two wings are not static zones but a coordination circuit of "Basic Research — Innovation Ecosystem — Industry Application": Source Station produces algorithms, models and computing power, transported via the intelligence track to Core Station for open-source collaboration, achievement incubation and talent transformation, then to Market Station for commercialization, enterprise acceleration and international roadshows. The two wings inject resources and feedback from capital (IP Wing) and scenarios (Scenario Wing).

The circuit achieves spatial stitching through three functional layers of the intelligence track axis:

Source Station

192.1 ha

Multi-Wisdom Park AI Innovation Acceleration Zone

Positioning

The technology source of the AI full-stack autonomous innovation system, corresponding to basic research, computing power and source innovation.

Spatial Structure

Organizing 3-4 research clusters (large models, embodied intelligence, AI for Science), placing a distributed computing hub at the center, setting up a "Researcher's Promenade" along the northern heritage park section, and reserving an autonomous vehicle shuttle test segment connecting Source and Core Stations.

AI Scenarios

- AI+research assistance
- computing sharing platform
- open-source model incubator
- AI for Science laboratory

Core Station

Beijing AI Origin Community

104.3 ha

Positioning

The heart of the world-class AI innovation ecosystem, the "living room" of the innovation belt, corresponding to open-source collaboration, achievement incubation and talent community.

Spatial Structure

Organizing a public space network centered on the "Open Source Plaza", laying out third-space networks (cafes, co-working, maker spaces), setting up an AI life experience zone (AI+healthcare, AI+education, AI+legal), and connecting east-west to the Xiaoyuehe Scenario Wing.

AI Scenarios

- Agent Contribution Honor Wall
- Open Source Achievement Gallery
- AI Community Council
- AI+adaptive learning space

Market Station

72.0 ha

Dazhongsi AI Industry Cluster

Positioning

The AI industry commercialization outlet, corresponding to enterprise acceleration, smart commerce and international roadshows.

Spatial Structure

Organizing a smart commercial district (unmanned retail, AI guides, virtual fitting), enterprise service hub (AI accelerator, compliance center, data trading platform), industry showcase window and TOD complex (integrating commerce, office and public services).

AI Scenarios

- AI+smart commerce experience
- robot delivery corridor
- AI+enterprise compliance service
- smart native consumption scenarios

Core Metrics System

The metrics system comprises three categories: spatial metrics calculable from submitted geometry (boundary area, green ratio, public space ratio, building footprint, phasing area); control metrics requiring official regulatory support (FAR, building height, density, setbacks, road red lines, facility standards); and performance metrics requiring operational data calibration (AI innovation index, talent density, slow mobility accessibility, etc.).

Note: All area values are provisional estimates, subject to recalculation upon official polygon release.
