

HEADROOM JINGZHANG / 京张余量带

Provisional rough geometry supports generation, display and intake checks only; key areas are not verified against station/road anchors. All spatial moves and metrics are concepts requiring full recalculation after official data arrives.

Complete partition and reversible capacity

Five bands fully cover the provisional envelope. Reserve land is convertible capacity, not vacant land awaiting development.

Key areas and scenario interfaces

The three areas hold technical, everyday and event headroom; the first three interfaces are industrial validation scenarios.

Provisional rough geometry: generation, display and intake only. Concept values require full-package recalculation after official data arrives.

Mobility, blue-green and human takeover

The spine and wings express connectivity, not road redlines, engineering alignments or station-integration conclusions.

ONE SPINE, TWO WINGS: DAILY LIFE AND FAILURE SHARE A NETWORK

Slow travel, services, blue-green space, evacuation and takeover share connections; alignments remain pending

reserve spine

dispatch wings

blue-green recovery

human takeover

- outage: fixed signs + human desk
- peak: public space enters recovery
- heat: shade prioritized in green band
- test: non-test route stays open

Provisional rough geometry: generation, display and intake only. Concept values require full-package recalculation after official data arrives.

Metrics, coverage and recalculation trigger

Known values are recomputed from GeoJSON; FAR, height, road area, ownership, utilities and heritage controls remain pending.
