

Future Hutong

Give time back to ordinary people

AI recedes into the background. Streets, courtyards, and people return to the foreground.

If a future city makes people get home later, more sensors do not make it smarter.

This proposal begins with an ordinary wish: less time stuck, a calmer transfer, and an earlier return home. Seniors, repair crews, shopkeepers, students, and researchers should share the benefits of AI. Along the railway, people should once again find places to sit, meet, talk, and look after one another.

01

AI RECEDES

02

PUBLIC TRANSPORT FIRST

03

NO ACCOUNT REQUIRED

04

NEIGHBORHOOD LIFE RETURNS

Future Hutong

Give time back to ordinary people

AI recedes into the background. Streets, courtyards, and people return to the foreground.

Smallest design unit: one person, one trip, one courtyard, one reclaimable stretch of time.

11.4128 km²

Provisional overall area

Medium confidence / not an official boundary

17.58%

Concept green-space ratio

Low confidence / not a statutory control

9.27%

Concept public-space ratio

Low confidence / not a statutory control

CONCEPT BOUNDARY / NOT FOR APPROVAL / RECALCULATE WHEN OFFICIAL DATA ARRIVE

JING-ZHANG / PROVISIONAL

Land use is not a four-color card. It is four kinds of daily life.

0702

Neighborhood life + public service

Care, teaching, repair, errands, and a staffed entrance that never requires registration.

1401

Jing-Zhang park + green commons

Shade, pause, rain gardens, and screen-free public life as the civic ground layer.

0802

Shared making + R&D education

Research, prototyping, standards, safety review, and long-term maintenance together.

05

Everyday commerce + services

Small shops, culture, public service, and responsible demonstrations keep life continuous.

ONE HOMECOMING CORRIDOR / THREE COURTYARDS / TWO INTERFACES / TWELVE DAILY TESTS

Codes describe concept relationships; they do not amend statutory land use.

Three courtyards. Three forms of daily life.

01

Zhongzhiyuan

TOOLMAKING COURTYARD

Interoperability, traffic shadow simulation, safety standards, and frontline repair.

TOOLMAKING COURTYARD

Make tools; publish error, energy, incident, and retirement records.

02

AI Origin

CO-RESEARCH COURTYARD

Translate research into plain language before co-review, prototyping, and human sign-off.

CO-RESEARCH COURTYARD

Research reaches the neighborhood; ground floors support care and repair.

03

Dazhongsi

HUNDRED TRADES COURTYARD

Small shops, public service, accessible transfers, and ordinary international exchange.

HUNDRED TRADES COURTYARD

Cash, paper, telephone, and staffed service always remain.

Signals begin in shadow mode.

Now: demonstrate on a fixed cycle; read no live data.

- 01

Aggregate queues, bus arrivals, and button requests enter a shadow model.
- 02

Compare pedestrian safety, bus reliability, spillover, and the worst-served group together.
- 03

A transport professional approves advice; the controller retains original timing.
- 04

Only a permitted, time-limited pilot may go live; anomalies trigger immediate rollback.
- 05

A public receipt names who benefits, who bears cost, who approved, and why a test stopped.

DO NOT COLLECT

No facial recognition by default; personal traces never become the price of public convenience.

PROTECT FIRST

Pedestrian safety and access, bus reliability, cycling continuity—then general vehicle efficiency.

What can be recalculated—and what remains unknown.

Decimals show that layers reconcile. They do not prove that the city improved.

A real time dividend must be filled in by affected people and an approved pilot.

MACHINE PASS ≠ PROFESSIONAL ACCEPTANCE

PROFESSIONAL ACCEPTANCE ≠ PUBLIC CONSENT

PUBLIC CONSENT ≠ IMPLEMENTATION APPROVAL

Provisional overall design area	11.4128 km ²	Medium confidence; recalculated from a provisional polygon, not an official area.	
Concept green / public-space ratio	17.58% / 9.27%	Low confidence; layer-consistency checks, not statutory controls.	
Homecoming time dividend	UNKNOWN	Requires compensated travel diaries, affected-user baselines, and a bounded pilot.	
Signal-delay improvement	UNKNOWN	Requires authority data, microsimulation, safety review, and an approved field test.	
23 tasks covered	15 depth items	12 scenario nodes	0 real consultations

SCN-01

Adaptive-signal shadow test

Aggregated flows only; people walking and buses first; a transport professional approves any time-limited pilot.

SCN-02

Reliable-transfer steward

Recommends connections but never dispatches automatically; station staff retain judgment.

SCN-03

Accessible-crossing extension

A broken link anywhere in the complete journey fails the test; physical buttons and human requests come first.

SCN-04

Neighborhood service counter

Paper, telephone, and staffed service remain alongside digital service.

SCN-05

Small-shop digital apprentice

Merchants approve every item; cash and staff-assisted ordering remain.

SCN-06

Frontline maintenance workshop

Tools serve crews; automated worker scoring is prohibited.

SCN-07

Research-to-neighborhood table

Uses public research only; an author or librarian reviews the explanation.

SCN-08

Jing-Zhang memory booth

Explicit consent, withdrawal, deletion, and human fact-checking are mandatory.

SCN-09

Equivalent non-AI service desk

Paired-path testing compares completion, time, cost, access, and dignity; expansion stops if any group loses.

SCN-10

Civic-agent sandbox

Synthetic data first, staffed operation, and human confirmation for every real-world action.

SCN-11

Full-stack interoperability bench

Uses cleared benchmarks and returns interfaces and failure reports to the commons.

SCN-12

Public algorithm jury table

AI never decides complaints; residents, accessibility representatives, and professionals review together.

Evidence before expansion. An owner before operation.

01	BASE	Replace provisional boundaries; add development controls, surveys, ownership, heritage, utilities, traffic, and affected-user baselines.
02	LIGHT START	Only shadow simulations, removable furniture, staffed service, and three to four bounded sandboxes.
03	LINK COURTS	After approval, repair accessibility, cycling gaps, and existing ground-floor connections.
04	FORM NETWORK	Scale only projects that pass safety, public-interest, operations, and non-AI-equivalence review.
05	RETIRE	Re-certify yearly; remove obsolete models, devices, and operators with a funded exit path.

A data gap is a design boundary, not empty space.

SOURCES

Official announcements and the task package support facts.
Provisional spatial data support concept testing only. Global cases support mechanism comparison, not local controls.

ASSUMPTIONS

Missing: official polygon, development controls, building survey, ownership, road redlines, heritage, utilities, traffic baseline, operating owners, and public consultation.

REVIEW STATUS

Structural, citation, spatial, display, and offline-safety checks establish package consistency. They do not prove official recognition, engineering feasibility, public acceptance, or implementation approval.

O consultations with real affected users so far

This is a hard gate, not a modest disclaimer. Residents, bus and station staff, frontline workers, merchants, seniors, caregivers, and people with disabilities must be invited with compensation. Composite personas cannot consent on their behalf. AI and non-AI paths should be tested on the same tasks, with results separated by group rather than averaged away.

Participation means being able to refuse, correct, and exit.

A future city does not need AI everywhere.

If people choose to linger, the city has arrived.
