

Jing-Zhang Intelligence Belt · Urban Proving Corridor

Centennial Jing-Zhang AI Innovation Belt international urban design call · A3 booklet

Entry HYKQL-K / jingzhang-proving-belt

This proposal designs the Centennial Jing-Zhang AI Innovation Belt as a continuously operating, publicly auditable urban proving corridor. Its replicable smallest unit is the validation unit, made of four parts: a spatial host, a validation protocol, a public disclosure board and an exit mechanism. Nine segments and five bands along the Jing-Zhang Heritage Park link Zhongzhiyuan, the AI Origin Community and Dazhongsi, supplied by the Zhongguancun service wing and the Xiaoyue River scenario wing.

Core loop: propose → validate → disclose → convert

Three hard constraints

- Failure must be disclosed: projects that fail validation, and the reasons why, enter the same public board as the successes.
- The human fallback must not be slower or costlier: every AI service keeps a staffed channel, and choosing it must carry no penalty in time or fee.
- Opt-in by default: data capture and intelligent services in public space are off until the user actively joins.

The validation unit: four parts

Compliance premise: gaps in official planning controls

No precise red line, GIS dataset or control indicator is published for this project. Every spatial and quantitative conclusion rests on the organiser-registered provisional rough surrogate extents (official_boundary=false, geometry_role=provisional_constraint). They are conceptual suggestions and are not regulatory-plan conclusions, approval outcomes, tenure conclusions or implementation commitments. Full recomputation is required once official boundaries and controls are published.

Contents

- 01 Three-level scope and evidence chain
- 02 Land-use structure (nine segments, five bands)
- 03 Key areas and AI scenarios
- 04 Mobility and blue-green public space
- 05 Core metrics, phasing and evidence chain
- 06 Metric system, task coverage and compliance

Land-Use Structure • Nine Segments and Five Bands

Overall design area approx. 11.4 km² | 45 seamless non-overlapping cells | EPSG:4326 exchange, EPSG:4548 area recalculation

Conceptual proposal only. Partition lines express no road red line, no parcel tenure and no approval conclusion. The base extent is the organiser-registered provisional road boundary official_boundary=false; every layer and metric must be recalculated as a whole once the official precise red line is published. Land-use codes follow the national land and sea use classification guideline. The three equal-scale panels show the same corridor in sequence, B1 to B9 from south to north. Data: geometry/land_use.geojson, geometry/roads.geojson, geometry/site_boundary.geojson.

Key points

- 01** Nine segments and five bands break the strip site into 45 manageable cells, seamless and non-overlapping, with an 84 sqm residual far below tolerance.
- 02** 416,693 sqm of reserved land is spread along the spine for validation demands that have not yet appeared, with no pre-assigned use.
- 03** Building scale is indicative; floor area ratio and height caps are left blank pending official indicators.

AI scenario nodes

Each key area carries one validation theme: Zhongzhiyuan for full-stack independent innovation and pilot production, the AI Origin Community for living scenarios and public participation, Dazhongsi for intelligence-native consumption and interchange validation. Twelve AI scenario nodes are distributed along the belt, four of them industry validation scenarios, each stating its principal beneficiaries and data boundary.

Data sources

geometry/key_areas.geojson, geometry/constraints.geojson, geometry/public_space.geojson, geometry/land_use.geojson

Validation unit = spatial carrier + protocol + disclosure board + exit mechanism

Three hard constraints: failures must be disclosed; the human fallback may never be slower or costlier; non-participation is the default. Numbered dots are AI scenario nodes; filled dots are industry validation scenarios.

Boundaries are provisional rough surrogate extents inferred from public information (official_boundary=false, geometry_role=provisional_constraint). They do not represent official red lines, approval outcomes or implementation commitments. Areas and lengths are computed in EPSG:4548; exchange coordinates are

Key points

- 01 Each key area carries the four-part validation unit: spatial host, validation protocol, disclosure board and exit mechanism.
- 02 Twelve scenario nodes cover mobility, enterprise services, public safety, culture, health and delivery; four are industry validation scenarios.
- 03 Scenario points are indicative and express no siting conclusion; entry conditions need sector regulator and industry agreement.

Figure 4 Mobility and blue-green public space structure

Centennial Jing-Zhang AI Innovation Belt - Urban Proving Corridor - conceptual proposal

Alignments and green space are conceptual suggestions and do not express road red lines, cross-section design or ownership boundaries. Lengths are computed in EPSG:4548; exchange coordinates are EPSG:4326. Data: geometry/roads.geojson, geometry/green_space.geojson, geometry/public_space.geojson, metrics.json. Extents are provisional rough surrogates (official_boundary=false) and must be fully recomputed once official precise boundaries are published.

Mobility and blue-green principles

Separate people and machines

The greenway carriageway is suggested at no less than 6 m clear width; robot validation lanes are physically separated from footways, with human-priority stretches.

Stitching first

Seven east-west pedestrian stitches cross the rail corridor and remove detour barriers; no stitch may be closed for a validation activity.

Interchange validation

Three rail interchange connections carry first-and-last-mile low-speed autonomous validation while retaining conventional walking and staffed interchange.

Continuous blue-green

Park green space runs continuously along the proving spine, with buffer green edging the Xiaoyue River interface; green ratio is about 29.41%.

Accessibility floor

Validation activities may never occupy accessible passage width; plazas must retain a fully staffed service counter.

Al scenario nodes

The proving spine along the Jing-Zhang Heritage Park forms the north-south skeleton. Seven east-west pedestrian stitches cross the rail corridor and remove detour barriers; three rail interchange connections carry first-and-last-mile low-speed autonomous validation. The greenway is suggested at no less than 6 m clear width, with robot validation lanes physically separated from footways and human-priority stretches retained.

Data sources

geometry/roads.geojson, geometry/green_space.geojson,
geometry/public_space.geojson, metrics.json

Figure 4 Mobility and blue-green public space

Key points

- 01** The 9,722 m proving spine runs the full length; seven stitches totalling 8,198 m cross the rail corridor and remove east-west detours.
- 02** Robot validation lanes are physically separated from footways, with human-priority stretches retained so that people unfamiliar with the devices are not pushed out.
- 03** 3,356,625 sqm of green space and 1,295,403 sqm of public space run along the corridor; four proving plazas carry disclosure and assembly.

Metric system, task coverage and compliance

Core metrics

Overall design area	11,412,825 m²
Green ratio	29.41 %
Public space share	11.35 %
R&D land area	2,008,878 m²
Reserved land area	416,693 m²
Proving spine length	9,722.3 m
East-west stitches	7
AI scenario nodes	12
Industry validation scenarios	4
Key areas	3
Phase 1 area	3,169,220 m²
Official controls available	0

Task coverage

Industry and future-city research	Spatial demand of the full-stack AI chain
Renewal and regulatory-depth urban design	Nine-segment partition, mobility, blue-green, character
Detailed design of key areas	Three key areas and their validation units
AI ecosystem, talent and AI+ scenarios	12 nodes, beneficiary profiles, data boundaries
Project list, policy and phasing	Three-tier list, three devices, three phases
Metric system and compliance	25 metrics, recomputation, matrix, declared gaps

Evidence inventory in this package

23	compliance_matrix.json requirements mapped one by one
9	standard_matrix.json standards, laws and policies cited
15	design_depth_matrix.json design-depth items with sections and layers
25	metrics.json metrics: 23 known, 2 declared gaps
9	geometry/*.geojson layers, EPSG:4326 exchange, EPSG:4548 recalculation
5	assets/figures/*.png figures, one set per language

Phasing plan and measurable indicators

Phase 1 · proving cores 2026—2028 27.77 % of site One proving plaza and one spine sample segment in each of Dazhongsi, the AI Origin Community and Zhongzhiyuan, closing the propose-validate-disclose-convert loop. Measurable indicators 3 validation units built; at least 30 projects disclosed in total; 100 % of failures disclosed.	Phase 2 · spine and stitches 2029—2031 40.62 % of site Complete the north-south spine, deliver the Xiaoyue River scenario wing and the seven east-west stitches, removing the detours caused by the rail corridor. Measurable indicators Spine continuous end to end; 7 stitches built; continuous barrier-free surface along the whole belt.	Phase 3 · conversion to operation 2032—2035 31.61 % of site Stitch the Xueyuan Road education cluster and the Beixiaguan area, and shift validation from project mode into standing operation with the conversion channel institutionalised. Measurable indicators The conversion rate of validated results into procurement or standards is publicly reportable; the operator runs on a standing basis.
--	---	--

Three institutional devices

Validation protocol Before deployment each validation unit must sign a public protocol stating the scope of data capture, the retention period, the exit route and the accountable party. The protocol itself is public.	Failure disclosure Failures, suspensions and takeovers must be disclosed on the same board as the successes, with no selective release. Only recorded failure spares the next team from paying for it again.	Conversion channel Validated results need a defined route into adoption: a procurement catalogue, a local or association standard, or a published technical guideline. Without it, validation is only a demonstration.
---	---	---

Key assumptions

A-BOUNDARY-001	All areas rest on provisional rough extents; recompute once the official red line is published.
A-COVERAGE-001	Footprints come from assumed site coverage; neither a survey nor a regulatory conclusion.
A-MOBILITY-001	Alignments are conceptual; rail crossings need railway and municipal development.
A-CONTROLS-001	The five official controls are missing; no back-calculation is attempted.

Three kinds of metric

01	Recomputable geometry metrics: independently recalculable from geometry/ in the same CRS, with identical results for any third party.
02	Assumption-derived metrics such as building scale: confidence is bounded by the assumption, and each entry carries a caveat and assumption id.
03	Declared-gap metrics such as the count of available official controls, which is 0: their purpose is to keep the gap visible rather than fill it.

Compliance premise: gaps in official planning controls

No precise red line, GIS dataset or control indicator is published for this project. Every spatial and quantitative conclusion rests on the organiser-registered provisional rough surrogate extents (official_boundary=false, geometry_role=provisional_constraint). They are conceptual suggestions and are not regulatory-plan conclusions, approval outcomes, tenure conclusions or implementation commitments. Full recomputation is required once official boundaries and controls are published.

Boundaries of use

- Every spatial and quantitative conclusion in this booklet is a conceptual suggestion for further study by professional teams.
- It is not a regulatory-plan conclusion, an approval basis, a tenure boundary, a construction commitment or a fiscal commitment.
- No non-public, internal or classified data is used, no personal data is used, and no company list, investment figure or output value is invented.
- Once official boundaries and controls are published, the package must be recomputed as a whole on the same definitions, not patched locally.
