

Ordinary city first | STATUS $\times$ ACTION | $12 \rightarrow 3$ | three reversible interfaces

IN-PLACE RENEWAL · STATUS × ACTION

An 11.4 km² conceptual field: keep the existing city working first; then decide where, when and how to renew through status, action and evidence gates

IN-PLACE RENEWAL · STATUS x ACTION

03 / THREE PLACES

North water-compound-arrival; middle public-side campus threshold; south grade-separated station city. They do not share one formal answer

IN-PLACE RENEWAL · STATUS × ACTION

05 / PROVE + PAUSE

12 TASKS → 3 DEEP SPATIAL PACKETS → 9 ORDINARY OR NO BUILD

12 TASKS

3 DEEP

9

ORDINARY / NO BUILD

Without G0 evidence, rights, carrier and human authority; retain ordinary city; three D0-D100 contracts record evidence, stop and reset only

KNOWN / DERIVED

- provisional site geometry: 11.4 km²
- 17 control patches; 15 project families; 12 scenarios
- concept green/public ratios: 20.9%
9.8%

DESIGN RULES

- retain first status never authorizes action
- public route never depends on controlled campus interior
- no real task, spatial delta or safety condition = NO BUILD

UNKNOWN / PAUSE

- statutory FAR, height, rights, capacity and official boundaries
- building condition, heritage, road/rail engineering and environmental survey
- official data triggers full recalculation, not a footnote

IMPLEMENTATION JUDGMENT

Placing NO BUILD, survey, reversible testing, professional review and exit/reuse at the start of the project chain is what gives in-place renewal implementation credibility.

CONCEPT / PROVISIONAL EXTENT | NOT PARCEL, REDLINE OR ENGINEERING CONCLUSION

02 THE THREE PLACES

Not three matching AI landmarks, but different spatial answers to three urban conditions.

IN-PLACE RENEWAL · STATUS × ACTION

03 / THREE PLACES

Three Key Areas: Three Spatial Objects

North water–compound–arrival; middle public-side campus threshold; south grade-separated station city. They do not share one formal answer.

ZHONGZHIYUAN AI ACCELERATION AREA

water → public landscape → controlled productive / service edge

BEIJING AI ORIGIN COMMUNITY

street / park → ordinary public room → reversible control → campus

DAZHONGSI AI INDUSTRY CLUSTER

arrival → walking / cycling → mixed frontage → professional adoption

Urban-space sequence (concept illustration): regional arrival → ordinary city → public threshold → adapted carrier → controlled task → ordinary city

north: water–compound–regional arrival

middle: public-side campus threshold

south: grade-separated station city

03 HOW IT WORKS

Public systems, AI tasks, NO BUILD, project phasing and evidence boundaries together form the implementation logic.

Jing-Zhang In Place

IN-PLACE RENEWAL · STATUS × ACTION

Move, Breathe and Service: One Operable Urban System

Walking, accessibility, cycling, regional arrival, service/maintenance and blue-green public realm are coordinated in one urban section—not overlaid as separate systems.

FIVE RELATIONS, NOT ONE LINE

- ordinary public route / regional arrival
- controlled threshold
- service / logistics / maintenance
- blue-green interface
- walking / cycling connection

Public routes do not depend on campus interior; service and maintenance are not hidden by landscape; grade-separated connections begin with access and continuity audit.

BLUE-GREEN IS NOT BACKGROUND

Root zones, drainage, shade, rain refuge, maintenance access and night boundaries together determine whether public space works.

AI OFF STILL HOLDS

Fixed signs, physical alternatives, staffed help, public space and service protocols remain usable when digital systems are off.

Evidence, Unknowns and Gates: Prove Before Acting

Credibility does not come from more numbers. It comes from clearly separating known, derived, conceptual and survey-required conditions.

CONCEPT / PROVISIONAL EXTENT | NOT PARCEL, REDLINE OR ENGINEERING CONCLUSION
