

BM0 · BENCHMARK ZERO

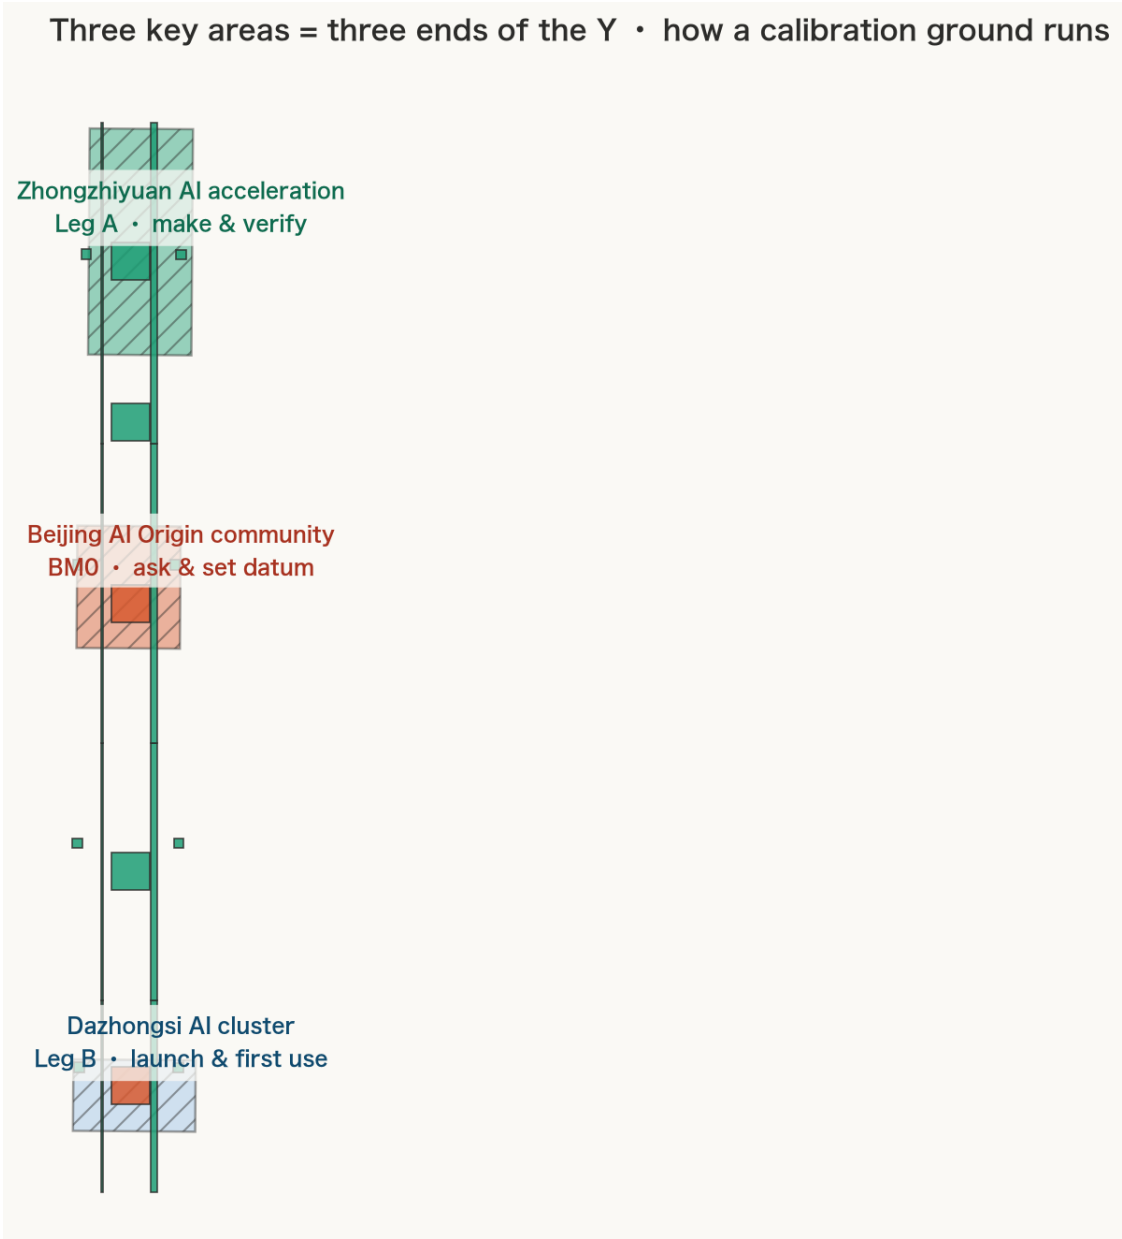

Everywhere else ranks models. This place measures reality.
Y/switchback on a 1:7 rail corridor, anchored on the Jing-Zhang railway's first autonomous survey and datum setting.
Three ends: ask (origin) - make (Zhongzhiyuan) - launch (Dazhongsi).
Two wings: Zhongguancun service + Xiaoyuehe empowerment.

Land-use structure

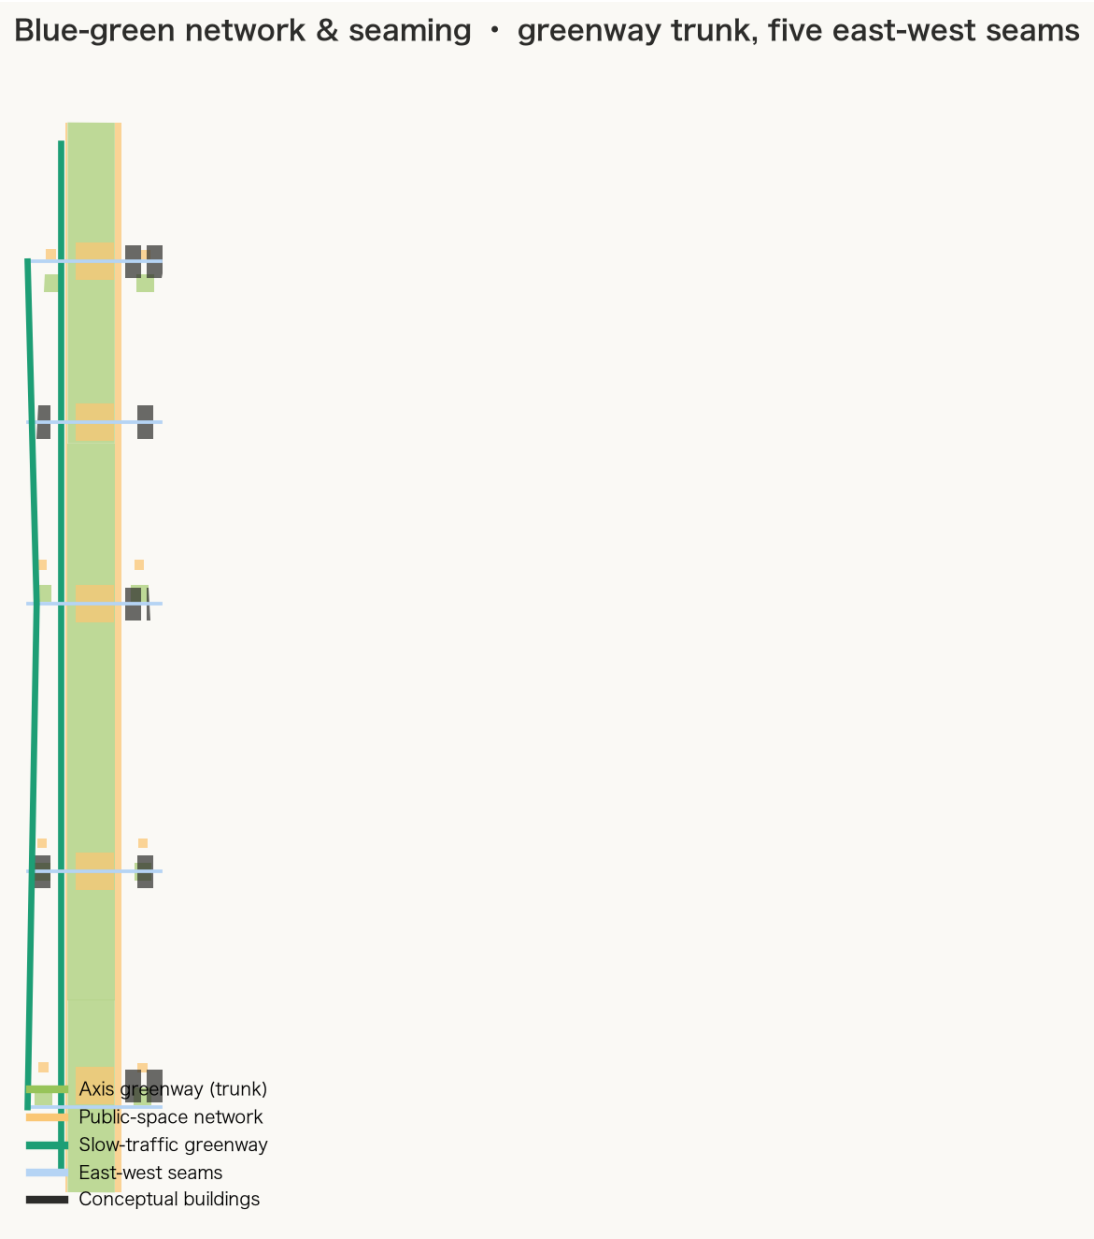

Five bands: west living - axis public - axis greenway - axis public - east innovation.
Green ratio 33.1%, public-space ratio 12.9%, recomputed from the submitted geometry in EPSG:4548.
Land-use partition tiles the boundary exactly: no gaps, no overlaps.

Three key areas = three ends of the Y

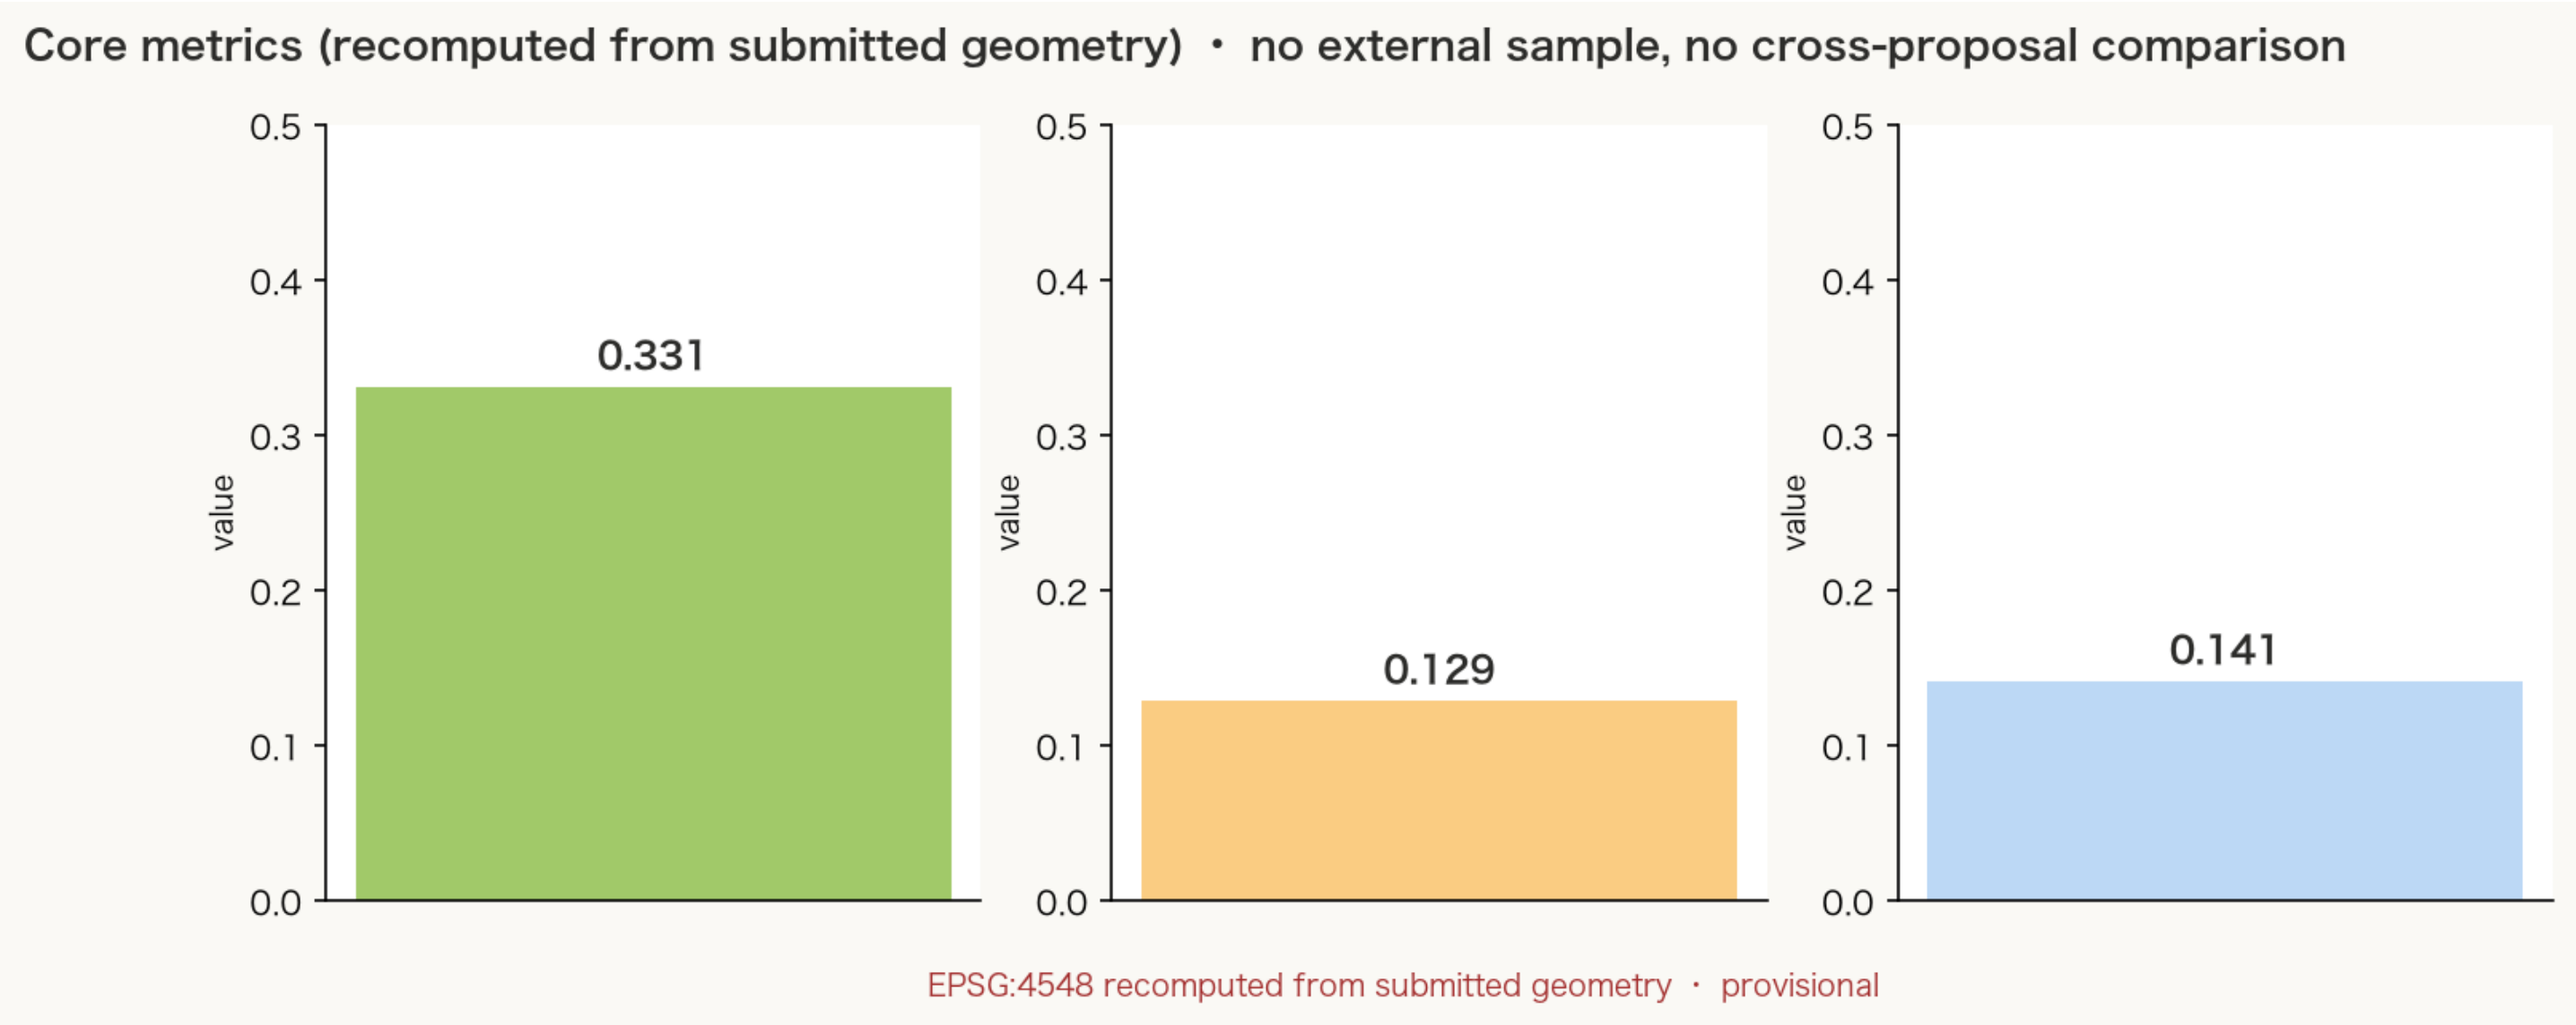

Leg A (Zhongzhiyuan): make & verify, embodied-intelligence safety ground.
Junction (BM0 origin): ask & set standards, open evaluation.
Leg B (Dazhongsi): launch & first use, AI-native formats.

Blue-green network & seaming

Continuous greenway trunk: 31.2% of site width, runs the full site length.
Five east-west seaming passages cross the axis with accessible continuity.
Public-space network: 5 BM nodes + 4 edge bands + 8 neighbourhood squares.

Core metrics (recomputed)

Green ratio 0.331, public-space ratio 0.129 (recomputed from the submitted geometry in EPSG:4548).
Width-to-length 0.141: the linear form is the physical precondition for the Y reading.
No external sample, no cross-proposal comparison claimed. Site anchoring is a qualitative argument — see assumptions.json.
